## 1.1 Introduction

The core of the Vienna RNA Package ([10], [8]) is formed by a collection of routines for the prediction and comparison of RNA secondary structures. These routines can be accessed through stand-alone programs, such as RNAfold, RNAdistance etc., which should be sufficient for most users. For those who wish to develop their own programs we provide a library which can be linked to your own code.

This document describes the library and will be primarily useful to programmers. However, it also contains details about the implementation that may be of interest to advanced users. The stand-alone programs are described in separate man pages. The latest version of the package including source code and html versions of the documentation can be found at

<http://www.tbi.univie.ac.at/RNA/>

## Chapter 2

# Installation and Configuration of RNAlib Features

### 2.1 Installing the ViennaRNA Package

For best portability the ViennaRNA package uses the GNU autoconf and automake tools. The instructions below are for installing the ViennaRNA package from source. However, pre-compiled binaries for various Linux distributions, as well as for Windows users are available from Download section of the [main ViennaRNA homepage](#).

#### 2.1.1 Quick-start

Usually you'll just unpack, configure and make. To do this type:

```
tar -zxvf ViennaRNA-2.4.2.tar.gz
cd ViennaRNA-2.4.2
./configure
make
sudo make install
```

#### 2.1.2 Installation without root privileges

If you do not have root privileges on your computer, you might want to install the ViennaRNA Package to a location where you actually have write access to. To do so, you can set the installation prefix of the ./configure script like so:

```
./configure --prefix=/home/username/ViennaRNA
make install
```

This will install the entire ViennaRNA Package into a new directory ViennaRNA directly into the users username home directory.

### 2.1.3 Notes for MacOS X users

Although users will find `/usr/bin/gcc` and `/usr/bin/g++` executables in their directory tree, these programs are not at all what they pretend to be. Instead of including the GNU programs, Apple decided to install clang/llvm in disguise. Unfortunately, the default version of clang/llvm does not support OpenMP (yet), but only complains at a late stage of the build process when this support is required. Therefore, it seems necessary to deactivate OpenMP support by passing the option `--disable-openmp` to the `./configure` script.

Additionally, since MacOS X 10.5 the perl and python installation distributed with MacOS X always include so called universal-binaries (a.k.a. fat-binaries), i.e. binaries for multiple architecture types. In order to compile and link the programs, library, and scripting language interfaces of the ViennaRNA Package for multiple architectures, we've added a new configure switch that sets up the required changes automatically:

```
./configure --enable-universal-binary
```

#### Note

Note, that with link time optimization turned on, MacOS X's default compiler (llvm/clang) generates an intermediary binary format that can not easily be combined into a multi-architecture library. Therefore, the `--enable-universal-binary` switch turns off link time optimization!

## 2.2 Configuring RNALib features

The ViennaRNA Package includes additional executable programs such as RNAforester, Kinfold, and Kinwalker. Furthermore, we include several features in our C-library that may be activated by default, or have to be explicitly turned on at configure-time. Below we list a selection of the available configure options that affect the features included in all executable programs, the RNALib C-library, and the corresponding scripting language interface(s).

### 2.2.1 Streaming SIMD Extension (SSE) support

Since version 2.3.5 our sources contain code that implements a faster multibranch loop decomposition in global MFE predictions, as used e.g. in RNAfold. This implementation makes use of modern processors capability to execute particular instructions on multiple data simultaneously (SIMD - single instruction multiple data, thanks to W. B. Langdon for providing the modified code). Consequently, the time required to assess the minimum of all multibranch loop decompositions is reduced up to about one half compared to the runtime of the original implementation. To make use of this piece of code you need a CPU capable to handle SSE4.1 instructions and enable the feature at compile-time using the following configure flag:

```
./configure --enable-sse
```

### 2.2.2 Scripting Interfaces

The ViennaRNA Package comes with scripting language interfaces for Perl 5, Python 2, and Python 3 (provided by swig), that allow one to use the implemented algorithms directly without the need of calling an executable program. The interfaces are build by default whenever the autoconf tool-chain detects the required build tools on your system. You may, however, explicitly turn off particular scripting language interface support at configure-time, for instance for Perl 5 and Python 2, before the actual installation.

Example:

```
./configure --without-perl --without-python
```

Disabling the scripting language support all-together can be accomplished using the following switch:

```
./configure --without-swig
```

### 2.2.3 Cluster Analysis

The programs AnalyseSeqs and AnalyseDists offer some cluster analysis tools (split decomposition, statistical geometry, neighbor joining, Ward's method) for sequences and distance data. To also build these programs add

```
--with-cluster
```

to your configure options.

### 2.2.4 Kinfold

The Kinfold program can be used to simulate the folding dynamics of an RNA molecule, and is compiled by default. Use the

```
--without-kinfold
```

option to skip compilation and installation of Kinfold.

### 2.2.5 RNAforester

The RNAforester program is used for comparing secondary structures using tree alignment. Similar to Kinfold, use the

```
--without-forester
```

option to skip compilation and installation of RNAforester.

### 2.2.6 Kinwalker

The Kinwalker algorithm performs co-transcriptional folding of RNAs, starting at a user specified structure (default↵: open chain) and ending at the minimum free energy structure. Compilation and installation of this program is deactivated by default. Use the

```
--with-kinwalker
```

option to enable building and installation of Kinwalker.

### 2.2.7 Link Time Optimization (LTO)

To increase the performance of our implementations, the ViennaRNA Package tries to make use of the Link Time Optimization (LTO) feature of modern C-compilers. If you are experiencing any troubles at make-time or run-time, or the configure script for some reason detects that your compiler supports this feature although it doesn't, you can deactivate it using the flag

```
./configure --disable-lto
```

Note, that GCC before version 5 is known to produce unreliable LTO code, especially in combination with SSE (see [Streaming SIMD Extension \(SSE\) support](#)). We therefore recommend using a more recent compiler (GCC 5 or above) or to turn off one of the two features, LTO or SSE optimized code.

### 2.2.8 OpenMP support

To enable concurrent computation of our implementations and in some cases parallelization of the algorithms we make use of the OpenMP API. This interface is well understood by most modern compilers. However, in some cases it might be necessary to deactivate OpenMP support and therefore transform *RNALib* into a C-library that is not entirely *thread-safe*. To do so, add the following configure option

```
./configure --disable-openmp
```

### 2.2.9 Stochastic backtracking using Boustrophedon scheme

Stochastic backtracking for single RNA sequences, e.g. available through the RNAsubopt program, received a major speedup by implementing a Boustrophedon scheme (see this article for details). If for some reason you want to deactivate this feature, you can do that by adding the following switch to the configure script:

```
./configure --disable-boustrophedon
```

### 2.2.10 SVM Z-score filter in RNALfold

By default, RNALfold that comes with the ViennaRNA Package allows for z-score filtering of its predicted results using a support vector machine (SVM). However, the library we use to implement this feature (libsvm) is statically linked to our own RNALib. If this introduces any problems for your own third-party programs that link against RNALib, you can safely switch off the z-scoring implementation using

```
./configure --without-svm
```

### 2.2.11 GNU Scientific Library

The new program RNApvmin computes a pseudo-energy perturbation vector that aims to minimize the discrepancy of predicted, and observed pairing probabilities. For that purpose it implements several methods to solve the optimization problem. Many of them are provided by the GNU Scientific Library, which is why the RNApvmin program, and the RNALib C-library are required to be linked against libgsl. If this introduces any problems in your own third-party programs that link against RNALib, you can turn off a larger portion of available minimizers in RN↔Apvmin and linking against libgsl all-together, using the switch

```
./configure --without-gsl
```

### 2.2.12 Disable C11/C++11 feature support

By default, we use C11/C++11 features in our implementations. This mainly accounts for unnamed unions/structs within *RNALib*. The configure script automatically detects whether or not your compiler understands these features. In case you are using an older compiler, these features will be deactivated by setting a specific pre-processor directive. If for some reason you want to deactivate C11/C++11 features despite the capabilities of your compiler, use the following configure option:

```
./configure --disable-c11
```

### 2.2.13 Enable warnings for use of deprecated symbols

Since version 2.2 we are in the process of transforming the API of our *RNAlib*. Hence, several symbols are marked as *deprecated* whenever they have been replaced by the new API. By default, deprecation warnings at compile time are deactivated. If you want to get your terminal spammed by tons of deprecation warnings, enable them using:

```
./configure --enable-warn-deprecated
```

### 2.2.14 Single precision partition function

Calculation of partition functions (via `RNAfold -p`) uses double precision floats by default, to avoid overflow errors on longer sequences. If your machine has little memory and you don't plan to fold sequences over 1000 bases in length you can compile the package to do the computations in single precision by running

```
./configure --enable-floatpf
```

#### Note

Using this option is discouraged and not necessary on most modern computers.

### 2.2.15 Help

For a complete list of all `./configure` options and important environment variables, type

```
./configure --help
```

For more general information on the build process see the `INSTALL.configure` file.

## 2.3 Linking against RNAlib

In order to use our implemented algorithms you simply need to link your program to our *RNAlib* C-library that usually comes along with the ViennaRNA Package installation. If you've installed the ViennaRNA Package as a pre-build binary package, you probably need the corresponding development package, e.g. *viennarna-devel*, or *viennarna-dev*. The only thing that is left is to include the ViennaRNA header files into your source code, e.g.:

```
#include <ViennaRNA/mfe.h>
```

and start using our fast and efficient algorithm implementations.

#### See also

In the [Examples](#) and [Some Examples using RNAlib API v3.0](#) sections, we list a small set of example code that usually is a good starting point for your application.

### 2.3.1 Compiler and Linker flags

Of course, simply adding the ViennaRNA header files into your source code is usually not enough. You probably need to tell your compiler where to find the header files, and sometimes add additional pre-processor directives. Whenever your installation of *RNAlib* was build with default settings and the header files were installed into their default location, a simple

```
-I/usr/include
```

pre-processor/compile flag should suffice. It can even be omitted in this case, since your compiler should search this directory by default anyway. You only need to change the path from */usr/include* to the correct location whenever the header files have been installed into a non-standard directory.

On the other hand, if you've compiled *RNAlib* with some non-default settings then you probably need to define some additional pre-processor macros:

- *VRNA\_DISABLE\_C11\_FEATURES* ... Disable C11/C++11 features.

#### Warning

Add this directive to your pre-processor/compile flags only if *RNAlib* was build with the *--disable-c11* configure option.

#### See also

[Disable C11/C++11 feature support](#) and [vrna\\_C11\\_features\(\)](#)

- *VRNA\_WARN\_DEPRECATED* ... Enable warnings for using deprecated symbols.

#### Note

Adding this directive enables compiler warnings whenever you use symbols in *RNAlib* that are marked *deprecated*.

#### See also

[Enable warnings for use of deprecated symbols](#) and [Deprecated List](#)

- *USE\_FLOAT\_PF* ... Use single precision floating point operations instead of double precision in partition function computations.

#### Warning

Define this macro only if *RNAlib* was build with the *--enable-floatpf* configure option!

#### See also

[Single precision partition function](#)

Simply add the corresponding definition(s) to your pre-processor/compile flags, for instance:

```
-DVRNA_DISABLE_C11_FEATURES
```

Finally, linking against *RNAlib* is achieved by adding the following linker flag

```
-L/usr/lib -lRNA -fopenmp
```

Again, the path to the library, */usr/lib*, may be omitted if this path is searched for libraries by default. The second flag tells the linker to include *libRNA.a*, and the remaining two flags activate [Link Time Optimization \(LTO\)](#) and [OpenMP support](#) support, respectively.

**Note**

Depending on your linker, the last two flags may differ.

Depending on your configure time decisions, you can drop one or both of the last flags.

In case you've compiled *RNAlib* with LTO support (See [Link Time Optimization \(LTO\)](#)) and you are using the same compiler for your third-party project that links against our library, you may add the

```
-flto
```

flag to enable Link Time Optimization.

### 2.3.2 The *pkg-config* tool

Instead of hard-coding the required compiler and linker flags, you can also let the *pkg-config* tool automatically determine the required flags. This tool is usually packaged for any Linux distribution and should be available for MacOS X and MinGW as well. We ship a file *RNAlib2.pc* which is installed along with the static *libRNA.a* C-library and populated with all required compiler and linker flags that correspond to your configure time decisions.

The compiler flags required for properly building your code that uses *RNAlib* can be easily obtained via

```
pkg-config --cflags RNAlib2
```

You get the corresponding linker flags using

```
pkg-config --libs RNAlib2
```

With this widely accepted standard it is also very easy to integrate *RNAlib* in your *autotools* project, just have a look at the *PKG\_CHECK\_MODULES* macro.

# Parsing and Comparing - Functions to Manipulate Structures

### Representations of Secondary Structures

The standard representation of a secondary structure is the *bracket notation*, where matching brackets symbolize base pairs and unpaired bases are shown as dots. Alternatively, one may use two types of node labels, 'P' for paired and 'U' for unpaired; a dot is then replaced by '(U)', and each closed bracket is assigned an additional identifier 'P'. We call this the expanded notation. In [6] a condensed representation of the secondary structure is proposed, the so-called homeomorphically irreducible tree (HIT) representation. Here a stack is represented as a single pair of matching brackets labeled 'P' and weighted by the number of base pairs. Correspondingly, a contiguous strain of unpaired bases is shown as one pair of matching brackets labeled 'U' and weighted by its length. Generally any string consisting of matching brackets and identifiers is equivalent to a plane tree with as many different types of nodes as there are identifiers.

Bruce Shapiro proposed a coarse grained representation [17], which, does not retain the full information of the secondary structure. He represents the different structure elements by single matching brackets and labels them as 'H' (hairpin loop), 'I' (interior loop), 'B' (bulge), 'M' (multi-loop), and 'S' (stack). We extend his alphabet by an extra letter for external elements 'E'. Again these identifiers may be followed by a weight corresponding to the number of unpaired bases or base pairs in the structure element. All tree representations (except for the dot-bracket form) can be encapsulated into a virtual root (labeled 'R'), see the example below.

The following example illustrates the different linear tree representations used by the package. All lines show the same secondary structure.

```
a) .(((...(((...)))...((...))))).
   (U) ((( (U) (U) ((( (U) (U) (U) P) P) P) (U) (U) (( (U) (U) P) P) P) (U) P) P) (U)
b) (U) (( (U2) (( (U3) P3) (U2) (( (U2) P2) P2) (U) P2) (U)
c) (( (H) (H) M) B)
   ((( (( (H) S) (( (H) S) M) S) B) S)
   ((( ((( (H) S) (( (H) S) M) S) B) S) E)
d) ((( ((( (( (H3) S3) (( (H2) S2) M4) S2) B1) S2) E2) R)
```

Above: [Tree](#) representations of secondary structures. a) Full structure: the first line shows the more convenient condensed notation which is used by our programs; the second line shows the rather clumsy expanded notation for completeness, b) HIT structure, c) different versions of coarse grained structures: the second line is exactly Shapiro's representation, the first line is obtained by neglecting the stems. Since each loop is closed by a unique stem, these two lines are equivalent. The third line is an extension taking into account also the external digits. d) weighted coarse structure, this time including the virtual root.

For the output of aligned structures from string editing, different representations are needed, where we put the label on both sides. The above examples for tree representations would then look like:

- a) (UU) (P (P (P (P (UU) (UU) (P (P (P (UU) (UU) (UU) P) P) P) (UU) (UU) (P (P (UU) (U...))
- b) (UU) (P2 (P2 (U2U2) (P2 (U3U3) P3) (U2U2) (P2 (U2U2) P2) P2) (UU) P2) (UU)
- c) (B (M (HH) (HH) M) B)  
 (S (B (S (M (S (HH) S) (S (HH) S) M) S) B) S)  
 (E (S (B (S (M (S (HH) S) (S (HH) S) M) S) B) S) E)
- d) (R (E2 (S2 (B1 (S2 (M4 (S3 (H3) S3) ( (H2) S2) M4) S2) B1) S2) E2) R)

Aligned structures additionally contain the gap character '\_'.

## Parsing and Coarse Graining of Structures

Several functions are provided for parsing structures and converting to different representations.

```
char *expand_Full(const char *structure)
```

Convert the full structure from bracket notation to the expanded notation including root.

```
char *b2HIT (const char *structure)
```

Converts the full structure from bracket notation to the HIT notation including root.

```
char *b2C (const char *structure)
```

Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.

```
char *b2Shapiro (const char *structure)
```

Converts the full structure from bracket notation to the *weighted* coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.

```
char *expand_Shapiro (const char *coarse);
```

Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).

```
char *add_root (const char *structure)
```

Adds a root to an un-rooted tree in any except bracket notation.

```
char *unexpand_Full (const char *ffull)
```

Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.

```
char *unweight (const char *wcoarse)
```

Strip weights from any weighted tree.

```
void unexpand_aligned_F (char *align[2])
```

Converts two aligned structures in expanded notation.

```
void parse_structure (const char *structure)
```

Collects a statistic of structure elements of the full structure in bracket notation.

## Distance Measures

A simple measure of dissimilarity between secondary structures of equal length is the base pair distance, given by the number of pairs present in only one of the two structures being compared. I.e. the number of base pairs that have to be opened or closed to transform one structure into the other. It is therefore particularly useful for comparing structures on the same sequence. It is implemented by

```
int bp_distance(const char *str1,
               const char *str2)
```

Compute the "base pair" distance between two secondary structures s1 and s2.

For other cases a distance measure that allows for gaps is preferable. We can define distances between structures as edit distances between trees or their string representations. In the case of string distances this is the same as "sequence alignment". Given a set of edit operations and edit costs, the edit distance is given by the minimum sum of the costs along an edit path converting one object into the other. Edit distances like these always define a metric. The edit operations used by us are insertion, deletion and replacement of nodes. String editing does not pay attention to the matching of brackets, while in tree editing matching brackets represent a single node of the tree. [Tree](#) editing is therefore usually preferable, although somewhat slower. String edit distances are always smaller or equal to tree edit distances.

The different level of detail in the structure representations defined above naturally leads to different measures of distance. For full structures we use a cost of 1 for deletion or insertion of an unpaired base and 2 for a base pair. Replacing an unpaired base for a pair incurs a cost of 1.

Two cost matrices are provided for coarse grained structures:

```
/* Null,  H,  B,  I,  M,  S,  E  */
{ 0,  2,  2,  2,  2,  1,  1}, /* Null replaced */
{ 2,  0,  2,  2,  2,  INF, INF}, /* H   replaced */
{ 2,  2,  0,  1,  2,  INF, INF}, /* B   replaced */
{ 2,  2,  1,  0,  2,  INF, INF}, /* I   replaced */
{ 2,  2,  2,  2,  0,  INF, INF}, /* M   replaced */
{ 1,  INF, INF, INF, INF,  0, INF}, /* S   replaced */
{ 1,  INF, INF, INF, INF,  INF,  0}, /* E   replaced */
```

```
/* Null,  H,  B,  I,  M,  S,  E  */
{ 0, 100,  5,  5,  75,  5,  5}, /* Null replaced */
{ 100,  0,  8,  8,  8,  INF, INF}, /* H   replaced */
{  5,  8,  0,  3,  8,  INF, INF}, /* B   replaced */
{  5,  8,  3,  0,  8,  INF, INF}, /* I   replaced */
{ 75,  8,  8,  8,  0,  INF, INF}, /* M   replaced */
{  5,  INF, INF, INF, INF,  0, INF}, /* S   replaced */
{  5,  INF, INF, INF, INF,  INF,  0}, /* E   replaced */
```

The lower matrix uses the costs given in [18]. All distance functions use the following global variables:

```
int cost_matrix;
```

Specify the cost matrix to be used for distance calculations.

```
int edit_backtrack;
```

Produce an alignment of the two structures being compared by tracing the editing path giving the minimum distance.

```
char *aligned_line[4];
```

Contains the two aligned structures after a call to one of the distance functions with [edit\\_backtrack](#) set to 1.

### Functions for [Tree](#) Edit Distances

```
Tree  *make_tree (char *struc)
```

Constructs a [Tree](#) ( essentially the postorder list ) of the structure 'struc', for use in [tree\\_edit\\_distance\(\)](#).

```
float  tree_edit_distance (Tree *T1,  
                          Tree *T2)
```

Calculates the edit distance of the two trees.

```
void    free_tree(Tree *t)
```

Free the memory allocated for [Tree](#) t.

#### See also

[dist\\_vars.h](#) and [treedist.h](#) for prototypes and more detailed descriptions

### Functions for String Alignment

```
swString *Make_swString (char *string)
```

Convert a structure into a format suitable for [string\\_edit\\_distance\(\)](#).

```
float    string_edit_distance (swString *T1,  
                              swString *T2)
```

Calculate the string edit distance of T1 and T2.

### Functions for Comparison of Base Pair Probabilities

For comparison of base pair probability matrices, the matrices are first condensed into probability profiles which are then compared by alignment.

```
float *Make_bp_profile_bppm ( double *bppm,  
                             int length)
```

condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.

```
float profile_edit_distance ( const float *T1,  
                             const float *T2)
```

Align the 2 probability profiles T1, T2

.

### 4.1 Producing secondary structure graphs

```
int PS_rna_plot ( char *string,
                  char *structure,
                  char *file)
```

Produce a secondary structure graph in PostScript and write it to 'filename'.

```
int PS_rna_plot_a (
    char *string,
    char *structure,
    char *file,
    char *pre,
    char *post)
```

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.

```
int gmlRNA (char *string,
            char *structure,
            char *ssfile,
            char option)
```

Produce a secondary structure graph in Graph Meta Language (gml) and write it to a file.

```
int ssv_rna_plot (char *string,
                 char *structure,
                 char *ssfile)
```

Produce a secondary structure graph in SStructView format.

```
int svg_rna_plot (char *string,
                 char *structure,
                 char *ssfile)
```

Produce a secondary structure plot in SVG format and write it to a file.

```
int xrna_plot ( char *string,
                char *structure,
                char *ssfile)
```

Produce a secondary structure plot for further editing in XRNA.

```
int rna_plot_type
```

Switch for changing the secondary structure layout algorithm.

Two low-level functions provide direct access to the graph layouting algorithms:

```
int simple_xy_coordinates ( short *pair_table,
                           float *X,
                           float *Y)
```

Calculate nucleotide coordinates for secondary structure plot the *Simple way*

```
int naview_xy_coordinates ( short *pair_table,
                           float *X,
                           float *Y)
```

## 4.2 Producing (colored) dot plots for base pair probabilities

```
int PS_color_dot_plot ( char *string,
                       cpair *pi,
                       char *filename)
```

```
int PS_color_dot_plot_turn (char *seq,
                           cpair *pi,
                           char *filename,
                           int winSize)
```

```
int PS_dot_plot_list (char *seq,
                     char *filename,
                     plist *pl,
                     plist *mf,
                     char *comment)
```

Produce a postscript dot-plot from two pair lists.

```
int PS_dot_plot_turn (char *seq,
                     struct plist *pl,
                     char *filename,
                     int winSize)
```

See also

[PS\\_dot.h](#) for more detailed descriptions.

## 4.3 Producing (colored) alignments

```
int PS_color_aln (
    const char *structure,
    const char *filename,
    const char *seqs[],
    const char *names[])
```

Produce PostScript sequence alignment color-annotated by consensus structure.

## 4.4 RNA sequence related utilities

Several functions provide useful applications to RNA sequences

```
char *random_string (int l,
    const char symbols[])
```

Create a random string using characters from a specified symbol set.

```
int hamming ( const char *s1,
    const char *s2)
```

Calculate hamming distance between two sequences.

```
void str_DNA2RNA(char *sequence);
```

Convert a DNA input sequence to RNA alphabet.

```
void str_uppercase(char *sequence);
```

Convert an input sequence to uppercase.

## 4.5 RNA secondary structure related utilities

```
char *pack_structure (const char *struc)
```

Pack secondary structure, 5:1 compression using base 3 encoding.

```
char *unpack_structure (const char *packed)
```

Unpack secondary structure previously packed with [pack\\_structure\(\)](#)

```
short *make_pair_table (const char *structure)
```

Create a pair table of a secondary structure.

```
short *copy_pair_table (const short *pt)
```

Get an exact copy of a pair table.

## 4.6 Miscellaneous Utilities

```
void print_tty_input_seq (void)
```

Print a line to *stdout* that asks for an input sequence.

```
void print_tty_constraint_full (void)
```

Print structure constraint characters to *stdout* (full constraint support)

```
void print_tty_constraint (unsigned int option)
```

Print structure constraint characters to *stdout*. (constraint support is specified by option parameter)

```
int  *get_iindx (unsigned int length)
```

```
int  *get_indx (unsigned int length)
```

```
void constrain_ptypes (
    const char *constraint,
    unsigned int length,
    char *ptype,
    int *BP,
    int min_loop_size,
    unsigned int idx_type)
```

Insert constraining pair types according to constraint structure string.

```
char  *get_line(FILE *fp);
```

Read a line of arbitrary length from a stream.

```
unsigned int read_record(
    char **header,
    char **sequence,
    char ***rest,
    unsigned int options);
```

Get a data record from *stdin*.

```
char  *time_stamp (void)
```

Get a timestamp.

```
void warn_user (const char message[])
```

Print a warning message.

```
void nrerror (const char message[])
```

Die with an error message.

```
void    init_rand (void)
```

Make random number seeds.

```
unsigned short xsubi[3];
```

Current 48 bit random number.

```
double urn (void)
```

get a random number from [0..1]

```
int      int_urn (int from, int to)
```

Generates a pseudo random integer in a specified range.

```
void     *space (unsigned size)
```

Allocate space safely.

```
void     *xrealloc ( void *p,  
                    unsigned size)
```

Reallocate space safely.

## Chapter 5

# RNAlib API v3.0

### 5.1 Introduction

With version 2.2 we introduce the new API that will take over the old one in the future version 3.0. By then, backwards compatibility will be broken, and third party applications using RNAlib need to be ported. This switch of API became necessary, since many new features found their way into the RNAlib where a balance between threadsafety and easy-to-use library functions is hard or even impossible to establish. Furthermore, many old functions of the library are present as slightly modified copies of themselves to provide a crude way to overload functions.

Therefore, we introduce the new v3.0 API very early in our development stage such that developers have enough time to migrate to the new functions and interfaces. We also started to provide encapsulation of the RNAlib functions, data structures, typedefs, and macros by prefixing them with *vrna\_* and *VRNA\_*, respectively. Header files should also be included using the *ViennaRNA/* namespace, e.g.

```
#include <ViennaRNA/fold.h>
```

instead of just using

```
#include <fold.h>
```

as required for RNAlib 1.x and 2.x.

This eases the work for programmers of third party applications that would otherwise need to put much effort into renaming functions and data types in their own implementations if their names appear in our library. Since we still provide backward compatibility up to the last version of RNAlib 2.x, this advantage may be fully exploited only starting from v3.0 which will be released in the future. However, our plan is to provide the possibility for an early switch-off mechanism of the backward compatibility in one of our next releases of ViennaRNA Package 2.x.

## Chapter 6

# Callback Functions

With the new v3.0 API *RNAlib* introduces so-called callback mechanisms for several functions.

This enables users of our library not only to retrieve computed data without the need for parsing complicated data structures, but also allows one to tweak our implementation to do additional tasks without the requirement of a re-implementation of basic algorithms.

Our implementation of the callback mechanisms always follows the same scheme: The user:

- defines a function that complies with the interface we've defined, and
- passes a pointer to said function to our implementations

In addition to the specific arguments of our callback interfaces, virtually all callbacks receive an additional *pass-through-pointer* as their last argument. This enables one to:

- encapsulate data, and
- provide thread-safe operations,

since this pointer is simply passed through by our library functions. It may therefore hold the address of an arbitrary, user-defined data structure.

Below, you find an enumeration of the individual callback functions that are available in *RNAlib*.

### Global [vrna\\_callback\\_free\\_auxdata](#) (void \*data)

This callback is supposed to free memory occupied by an auxiliary data structure. It will be called when the [vrna\\_fold\\_compound\\_t](#) is erased from memory through a call to [vrna\\_fold\\_compound\\_free\(\)](#) and will be passed the address of memory previously bound to the [vrna\\_fold\\_compound\\_t](#) via [vrna\\_fold\\_compound\\_add\\_auxdata\(\)](#).

### Global [vrna\\_callback\\_hc\\_evaluate](#) (int i, int j, int k, int l, unsigned char d, void \*data)

This callback enables one to over-rule default hard constraints in secondary structure decompositions.

### Global [vrna\\_callback\\_recursion\\_status](#) (unsigned char status, void \*data)

This function will be called to notify a third-party implementation about the status of a currently ongoing recursion. The purpose of this callback mechanism is to provide users with a simple way to ensure pre- and post conditions for auxiliary mechanisms attached to our implementations.

### Global [vrna\\_callback\\_sc\\_backtrack](#) (int i, int j, int k, int l, unsigned char d, void \*data)

This callback enables one to add auxiliary base pairs in the backtracking steps of hairpin- and interior loops.

**Global `vrna_callback_sc_energy` (`int i`, `int j`, `int k`, `int l`, `unsigned char d`, `void *data`)**

This callback enables one to add (pseudo-)energy contributions to individual decompositions of the secondary structure.

**Global `vrna_callback_sc_exp_energy` (`int i`, `int j`, `int k`, `int l`, `unsigned char d`, `void *data`)**

This callback enables one to add (pseudo-)energy contributions to individual decompositions of the secondary structure (Partition function variant, i.e. contributions must be returned as Boltzmann factors).

**Global `vrna_callback_ud_energy` (`vrna_fold_compound_t *vc`, `int i`, `int j`, `unsigned int loop_type`, `void *data`)**

This function will be called to determine the additional energy contribution of a specific unstructured domain, e.g. the binding free energy of some ligand.

**Global `vrna_callback_ud_exp_energy` (`vrna_fold_compound_t *vc`, `int i`, `int j`, `unsigned int loop_type`, `void *data`)**

This function will be called to determine the additional energy contribution of a specific unstructured domain, e.g. the binding free energy of some ligand (Partition function variant, i.e. the Boltzmann factors instead of actual free energies).

**Global `vrna_callback_ud_exp_production` (`vrna_fold_compound_t *vc`, `void *data`)**

The production rule for the unstructured domain grammar extension (Partition function variant)

**Global `vrna_callback_ud_probs_add` (`vrna_fold_compound_t *vc`, `int i`, `int j`, `unsigned int loop_type`, `FLT_OR_DBL exp_energy`, `void *data`)**

A callback function to store equilibrium probabilities for the unstructured domain feature

**Global `vrna_callback_ud_probs_get` (`vrna_fold_compound_t *vc`, `int i`, `int j`, `unsigned int loop_type`, `int motif`, `void *data`)**

A callback function to retrieve equilibrium probabilities for the unstructured domain feature

**Global `vrna_callback_ud_production` (`vrna_fold_compound_t *vc`, `void *data`)**

The production rule for the unstructured domain grammar extension

**Global `vrna_mfe_window_callback` (`int start`, `int end`, `const char *structure`, `float en`, `void *data`)**

This function will be called for each hit in a sliding window MFE prediction.

**Global `vrna_probs_window_callback` (`FLT_OR_DBL *pr`, `int pr_size`, `int i`, `int max`, `unsigned int type`, `void *data`)**

This function will be called for each probability data set in the sliding window probability computation implementation of `vrna_probs_window()`. The argument *type* specifies the type of probability that is passed to this function.

**Global `vrna_subopt_callback` (`const char *structure`, `float energy`, `void *data`)**

This function will be called for each suboptimal secondary structure that is successfully backtraced.

## Chapter 7

# Scripting Language interface(s)

Notes on functions and structures wrapped to the scripting language interface(s)

### 7.1 Introduction

For an easy integration into scripting languages, we provide an automatically generated interface to the RNAlib C-library, generated with scripting.

### 7.2 Function renaming scheme

The main difference when using a scripting language interface compared to direct calls of RNAlib C functions is, that the prefix 'vrna\_' is dropped. For instance, when calling the [vrna\\_fold\(\)](#) function, corresponding calls in perl or python are `RNA::fold()`, and `RNA.fold()`, respectively.

Functions that are dedicated to work on specific data structures only, e.g. the [vrna\\_fold\\_compound\\_t](#), are usually not exported at all. Instead, they are attached as object methods of a corresponding class (see [Object oriented Interface for data structures](#) for detailed information).

### 7.3 Object oriented Interface for data structures

For data structures, typedefs, and enumerations the 'vrna\_' prefixes are dropped as well, together with their suffixes '\_s', '\_t', and '\_e', respectively. Furthermore, data structures are usually transformed into classes and relevant functions of the C-library are attached as methods.

### 7.4 Examples

Examples on the basic usage of the scripting language interfaces can be found in the [Perl Examples](#) and [Python Examples](#) section.

### 7.5 Wrapper notes

Special notes on how functions, structures, enums, and macro definitions are actually wrapped, can be found here: [SWIG Wrapper Notes](#).

This function is available in an overloaded form where the last two parameters may be omitted, indicating `md = NULL`, and `options = VRNA_MEASURE_SHANNON_ENTROPY`, respectively.

**Global [vrna\\_aln\\_conservation\\_struct](#) (const char \*\*alignment, const char \*structure, const vrna\_md\_t \*md)**

This function is available in an overloaded form where the last parameter may be omitted, indicating `md = NULL`

**Global [vrna\\_commands\\_apply](#) (vrna\_fold\_compound\_t \*vc, vrna\_cmd\_t \*commands, unsigned int options)**

This function is attached as method `commands_apply()` to objects of type *fold\_compound*

**Global [vrna\\_db\\_flatten](#) (char \*structure, unsigned int options)**

This function flattens an input structure string in-place! The second parameter is optional and defaults to `VRNA_BRACKETS_DEFAULT`.

An overloaded version of this function exists, where an additional second parameter can be passed to specify the target brackets, i.e. the type of matching pair characters all brackets will be flattened to. Therefore, in the scripting language interface this function is a replacement for `vrna_db_flatten_to()`.

**Global [vrna\\_db\\_flatten\\_to](#) (char \*string, const char target[3], unsigned int options)**

This function is available as an overloaded version of `vrna_db_flatten()`

**Global [vrna\\_enumerate\\_necklaces](#) (const unsigned int \*type\_counts)**

This function is available as global function `enumerate_necklaces()` which accepts lists input, and produces list of lists output.

**Global [vrna\\_eval\\_covar\\_structure](#) (vrna\_fold\_compound\_t \*vc, const char \*structure)**

This function is attached as method `eval_covar_structure()` to objects of type *fold\_compound*

**Global [vrna\\_eval\\_hp\\_loop](#) (vrna\_fold\_compound\_t \*vc, int i, int j)**

This function is attached as method `eval_hp_loop()` to objects of type *fold\_compound*

**Global [vrna\\_eval\\_int\\_loop](#) (vrna\_fold\_compound\_t \*vc, int i, int j, int k, int l)**

This function is attached as method `eval_int_loop()` to objects of type *fold\_compound*

**Global [vrna\\_eval\\_loop\\_pt](#) (vrna\_fold\_compound\_t \*vc, int i, const short \*pt)**

This function is attached as method `eval_loop_pt()` to objects of type *fold\_compound*

**Global [vrna\\_eval\\_move](#) (vrna\_fold\_compound\_t \*vc, const char \*structure, int m1, int m2)**

This function is attached as method `eval_move()` to objects of type *fold\_compound*

Global **vrna\_eval\_move\_pt** (vrna\_fold\_compound\_t \*vc, short \*pt, int m1, int m2)

This function is attached as method **eval\_move\_pt()** to objects of type *fold\_compound*

Global **vrna\_eval\_structure** (vrna\_fold\_compound\_t \*vc, const char \*structure)

This function is attached as method **eval\_structure()** to objects of type *fold\_compound*

Global **vrna\_eval\_structure\_pt** (vrna\_fold\_compound\_t \*vc, const short \*pt)

This function is attached as method **eval\_structure\_pt()** to objects of type *fold\_compound*

Global **vrna\_eval\_structure\_pt\_verbose** (vrna\_fold\_compound\_t \*vc, const short \*pt, FILE \*file)

This function is attached as method **eval\_structure\_pt\_verbose()** to objects of type *fold\_compound*

Global **vrna\_eval\_structure\_verbose** (vrna\_fold\_compound\_t \*vc, const char \*structure, FILE \*file)

This function is attached as method **eval\_structure\_verbose()** to objects of type *fold\_compound*

Global **vrna\_exp\_params\_rescale** (vrna\_fold\_compound\_t \*vc, double \*mfe)

This function is attached to *vrna\_fc\_s* objects as overloaded **exp\_params\_rescale()** method.

When no parameter is passed to this method, the resulting action is the same as passing *NULL* as second parameter to **vrna\_exp\_params\_rescale()**, i.e. default scaling of the partition function. Passing an energy in kcal/mol, e.g. as retrieved by a previous call to the *mfe()* method, instructs all subsequent calls to scale the partition function accordingly.

Global **vrna\_exp\_params\_reset** (vrna\_fold\_compound\_t \*vc, vrna\_md\_t \*md\_p)

This function is attached to *vrna\_fc\_s* objects as overloaded **exp\_params\_reset()** method.

When no parameter is passed to this method, the resulting action is the same as passing *NULL* as second parameter to **vrna\_exp\_params\_reset()**, i.e. global default model settings are used. Passing an object of type *vrna\_md\_s* resets the fold compound according to the specifications stored within the *vrna\_md\_s* object.

### Class *vrna\_fc\_s*

This data structure is wrapped as an object **fold\_compound** with several related functions attached as methods.

A new **fold\_compound** can be obtained by calling one of its constructors:

- *fold\_compound(seq)* – Initialize with a single sequence, or two concatenated sequences separated by an ampersand character '&' (for cofolding)
- *fold\_compound(aln)* – Initialize with a sequence alignment *aln* stored as a list of sequences (with gap characters)

The resulting object has a list of attached methods which in most cases directly correspond to functions that mainly operate on the corresponding C data structure:

- *type()* – Get the type of the *fold\_compound* (See *vrna\_fc\_type\_e*)
- *length()* – Get the length of the sequence(s) or alignment stored within the *fold\_compound*

Global **vrna\_file\_commands\_apply** (vrna\_fold\_compound\_t \*vc, const char \*filename, unsigned int options)

This function is attached as method **file\_commands\_apply()** to objects of type *fold\_compound*

Global **vrna\_file\_msa\_detect\_format** (const char \*filename, unsigned int options)

This function exists as an overloaded version where the *options* parameter may be omitted! In that case, the *options* parameter defaults to *VRNA\_FILE\_FORMAT\_MSA\_DEFAULT*.

Global **vrna\_file\_msa\_read** (const char \*filename, char \*\*\*names, char \*\*\*aln, char \*\*id, char \*\*structure, unsigned int options)

In the target scripting language, only the first and last argument, *filename* and *options*, are passed to the corresponding function. The other arguments, which serve as output in the C-library, are available as additional return values. Hence, a function call in python may look like this:

```
num_seq, names, aln, id, structure = RNA.file_msa_read("msa.stk", RNA.FILE_FORMAT_MSA_STOCKHOLM)
```

After successfully reading the first record, the variable `num_seq` contains the number of sequences in the alignment (the actual return value of the C-function), while the variables `names`, `aln`, `id`, and `structure` are lists of the sequence names and aligned sequences, as well as strings holding the alignment ID and the structure as stated in the `SS_cons` line, respectively. Note, the last two return values may be empty strings in case the alignment does not provide the required data.

This function exists as an overloaded version where the `options` parameter may be omitted! In that case, the `options` parameter defaults to [VRNA\\_FILE\\_FORMAT\\_MSA\\_STOCKHOLM](#).

**Global `vrna_file_msa_read_record` (`FILE *fp`, `char ***names`, `char ***aln`, `char **id`, `char **structure`, `unsigned int options`)**

In the target scripting language, only the first and last argument, `fp` and `options`, are passed to the corresponding function. The other arguments, which serve as output in the C-library, are available as additional return values. Hence, a function call in python may look like this:

```
f = open('msa.stk', 'r')
num_seq, names, aln, id, structure = RNA.file_msa_read_record(f, RNA.FILE_FORMAT_MSA_STOCKHOLM)
f.close()
```

After successfully reading the first record, the variable `num_seq` contains the number of sequences in the alignment (the actual return value of the C-function), while the variables `names`, `aln`, `id`, and `structure` are lists of the sequence names and aligned sequences, as well as strings holding the alignment ID and the structure as stated in the `SS_cons` line, respectively. Note, the last two return values may be empty strings in case the alignment does not provide the required data.

This function exists as an overloaded version where the `options` parameter may be omitted! In that case, the `options` parameter defaults to [VRNA\\_FILE\\_FORMAT\\_MSA\\_STOCKHOLM](#).

**Global `vrna_file_msa_write` (`const char *filename`, `const char **names`, `const char **aln`, `const char *id`, `const char *structure`, `const char *source`, `unsigned int options`)**

In the target scripting language, this function exists as a set of overloaded versions, where the last four parameters may be omitted. If the `options` parameter is missing the options default to ([VRNA\\_FILE\\_FORMAT\\_MSA\\_STOCKHOLM](#) | [VRNA\\_FILE\\_FORMAT\\_MSA\\_APPEND](#)).

**Global `vrna_hc_add_from_db` (`vrna_fold_compound_t *vc`, `const char *constraint`, `unsigned int options`)**

This function is attached as method `hc_add_from_db()` to objects of type `fold_compound`

**Global `vrna_hc_init` (`vrna_fold_compound_t *vc`)**

This function is attached as method `hc_init()` to objects of type `fold_compound`

**Class `vrna_md_s`**

This data structure is wrapped as an object `md` with multiple related functions attached as methods.

A new set of default parameters can be obtained by calling the constructor of `md`:

- `md()` – Initialize with default settings

The resulting object has a list of attached methods which directly correspond to functions that mainly operate on the corresponding C data structure:

- `reset()` – [vrna\\_md\\_set\\_default\(\)](#)
- `set_from_globals()` – [set\\_model\\_details\(\)](#)
- `option_string()` – [vrna\\_md\\_option\\_string\(\)](#)

Note, that default parameters can be modified by directly setting any of the following global variables. Internally, getting/setting default parameters using their global variable representative translates into calls of the following functions, therefore these wrappers for these functions do not exist in the scripting language interface(s):

**Global [vrna\\_mfe](#) ([vrna\\_fold\\_compound\\_t](#) \*vc, char \*structure)**

This function is attached as method [mfe\(\)](#) to objects of type *fold\_compound*

**Global [vrna\\_mfe\\_dimer](#) ([vrna\\_fold\\_compound\\_t](#) \*vc, char \*structure)**

This function is attached as method [mfe\\_dimer\(\)](#) to objects of type *fold\_compound*

**Global [vrna\\_mfe\\_window](#) ([vrna\\_fold\\_compound\\_t](#) \*vc, FILE \*file)**

This function is attached as method [mfe\\_window\(\)](#) to objects of type *fold\_compound*

**Global [vrna\\_params\\_reset](#) ([vrna\\_fold\\_compound\\_t](#) \*vc, [vrna\\_md\\_t](#) \*md\_p)**

This function is attached to [vrna\\_fc\\_s](#) objects as overloaded [params\\_reset\(\)](#) method.

When no parameter is passed to this method, the resulting action is the same as passing *NULL* as second parameter to [vrna\\_params\\_reset\(\)](#), i.e. global default model settings are used. Passing an object of type [vrna\\_md\\_s](#) resets the fold compound according to the specifications stored within the [vrna\\_md\\_s](#) object.

**Global [vrna\\_params\\_subst](#) ([vrna\\_fold\\_compound\\_t](#) \*vc, [vrna\\_param\\_t](#) \*par)**

This function is attached to [vrna\\_fc\\_s](#) objects as [params\\_subst\(\)](#) method.

**Global `vrna_pbacktrack` (`vrna_fold_compound_t *vc`)**

This function is attached as overloaded method `pbacktrack()` to objects of type `fold_compound` that accepts an optional `length` argument. Hence, it serves as a replacement for `vrna_pbacktrack()`.

**Global `vrna_pbacktrack5` (`vrna_fold_compound_t *vc`, `int length`)**

This function is attached as overloaded method `pbacktrack()` to objects of type `fold_compound`

**Global `vrna_pf` (`vrna_fold_compound_t *vc`, `char *structure`)**

This function is attached as method `pf()` to objects of type `fold_compound`

**Global `vrna_pf_dimer` (`vrna_fold_compound_t *vc`, `char *structure`)**

This function is attached as method `pf_dimer()` to objects of type `fold_compound`

**Global `vrna_sc_add_bp` (`vrna_fold_compound_t *vc`, `int i`, `int j`, `FLT_OR_DBL energy`, `unsigned int options`)**

This function is attached as an overloaded method `sc_add_bp()` to objects of type `fold_compound`. The method either takes arguments for a single base pair (`i,j`) with the corresponding energy value:

```
fold_compound.sc_add_bp(i, j, energy, options)
```

or an entire 2-dimensional matrix with dimensions  $n \times n$  that stores free energy contributions for any base pair (`i,j`) with  $1 \leq i < j \leq n$ :

```
fold_compound.sc_add_bp(matrix, options)
```

In both variants, the `options` argument is optional can may be omitted.

**Global `vrna_sc_add_bt` (`vrna_fold_compound_t *vc`, `vrna_callback_sc_backtrack *f`)**

This function is attached as method `sc_add_bt()` to objects of type `fold_compound`

**Global `vrna_sc_add_data` (`vrna_fold_compound_t *vc`, `void *data`, `vrna_callback_free_auxdata *free_data`)**

This function is attached as method `sc_add_data()` to objects of type `fold_compound`

**Global `vrna_sc_add_exp_f` (`vrna_fold_compound_t *vc`, `vrna_callback_sc_exp_energy *exp_f`)**

This function is attached as method `sc_add_exp_f()` to objects of type `fold_compound`

**Global `vrna_sc_add_f` (`vrna_fold_compound_t *vc`, `vrna_callback_sc_energy *f`)**

This function is attached as method `sc_add_f()` to objects of type `fold_compound`

**Global `vrna_sc_add_hi_motif` (`vrna_fold_compound_t *vc`, `const char *seq`, `const char *structure`, `FLT_OR_DBL energy`, `unsigned int options`)**

This function is attached as method `sc_add_hi_motif()` to objects of type `fold_compound`

**Global `vrna_sc_add_SHAPE_deigan` (`vrna_fold_compound_t *vc`, `const double *reactivities`, `double m`, `double b`, `unsigned int options`)**

This function is attached as method `sc_add_SHAPE_deigan()` to objects of type `fold_compound`

**Global `vrna_sc_add_SHAPE_deigan_ali` (`vrna_fold_compound_t *vc`, `const char **shape_files`, `const int *shape_file_association`, `double m`, `double b`, `unsigned int options`)**

This function is attached as method `sc_add_SHAPE_deigan_ali()` to objects of type `fold_compound`

**Global `vrna_sc_add_SHAPE_zarringhalam` (`vrna_fold_compound_t *vc`, `const double *reactivities`, `double b`, `double default_value`, `const char *shape_conversion`, `unsigned int options`)**

This function is attached as method `sc_add_SHAPE_zarringhalam()` to objects of type `fold_compound`

**Global `vrna_sc_add_up` (`vrna_fold_compound_t *vc`, `int i`, `FLT_OR_DBL energy`, `unsigned int options`)**

This function is attached as an overloaded method `sc_add_up()` to objects of type `fold_compound`. The method either takes arguments for a single nucleotide `i` with the corresponding energy value:

```
fold_compound.sc_add_up(i, energy, options)
```

or an entire vector that stores free energy contributions for each nucleotide `i` with  $1 \leq i \leq n$ :

```
fold_compound.sc_add_bp(vector, options)
```

In both variants, the `options` argument is optional can may be omitted.

Global **`vrna_sc_init`** (`vrna_fold_compound_t *vc`)

This function is attached as method `sc_init()` to objects of type *fold\_compound*

Global **`vrna_sc_remove`** (`vrna_fold_compound_t *vc`)

This function is attached as method `sc_remove()` to objects of type *fold\_compound*

Global **`vrna_sc_set_bp`** (`vrna_fold_compound_t *vc`, `const FLT_OR_DBL **constraints`, unsigned int `options`)

This function is attached as method `sc_set_bp()` to objects of type *fold\_compound*

Global **`vrna_sc_set_up`** (`vrna_fold_compound_t *vc`, `const FLT_OR_DBL *constraints`, unsigned int `options`)

This function is attached as method `sc_set_up()` to objects of type *fold\_compound*

Global **`vrna_subopt`** (`vrna_fold_compound_t *vc`, int `delta`, int `sorted`, FILE `*fp`)

This function is attached as method `subopt()` to objects of type *fold\_compound*

Global **`vrna_subopt_cb`** (`vrna_fold_compound_t *vc`, int `delta`, `vrna_subopt_callback *cb`, void `*data`)

This function is attached as method `subopt_cb()` to objects of type *fold\_compound*

This function is attached as method `subopt_zuker()` to objects of type *fold\_compound*

Global **`vrna_ud_add_motif`** (`vrna_fold_compound_t *vc`, `const char *motif`, double `motif_en`, unsigned int `loop_type`)

This function is attached as method `ud_add_motif()` to objects of type *fold\_compound*

Global **`vrna_ud_remove`** (`vrna_fold_compound_t *vc`)

This function is attached as method `ud_remove()` to objects of type *fold\_compound*

Global **`vrna_ud_set_data`** (`vrna_fold_compound_t *vc`, void `*data`, `vrna_callback_free_auxdata *free_cb`)

This function is attached as method `ud_set_data()` to objects of type *fold\_compound*

Global **`vrna_ud_set_exp_prod_rule_cb`** (`vrna_fold_compound_t *vc`, `vrna_callback_ud_exp_production *pre_cb`, `vrna_callback_ud_exp_energy *exp_e_cb`)

This function is attached as method `ud_set_exp_prod_rule_cb()` to objects of type *fold\_compound*

Global **`vrna_ud_set_prob_cb`** (`vrna_fold_compound_t *vc`, `vrna_callback_ud_probs_add *setter`, `vrna_callback_ud_probs_get *getter`)

This function is attached as method `ud_set_prob_cb()` to objects of type *fold\_compound*

Global **`vrna_ud_set_prod_rule_cb`** (`vrna_fold_compound_t *vc`, `vrna_callback_ud_production *pre_cb`, `vrna_callback_ud_energy *e_cb`)

This function is attached as method `ud_set_prod_rule_cb()` to objects of type *fold\_compound*

## Chapter 9

# Input / Output File Formats

### 9.1 File formats for Multiple Sequence Alignments (MSA)

#### 9.1.1 ClustalW format

The *ClustalW* format is a relatively simple text file containing a single multiple sequence alignment of DNA, RNA, or protein sequences. It was first used as an output format for the *clustalw* programs, but nowadays it may also be generated by various other sequence alignment tools. The specification is straight forward:

- The first line starts with the words

```
CLUSTAL W
```

or

```
CLUSTALW
```

- After the above header there is at least one empty line
- Finally, one or more blocks of sequence data are following, where each block is separated by at least one empty line

Each line in a blocks of sequence data consists of the sequence name followed by the sequence symbols, separated by at least one whitespace character. Usually, the length of a sequence in one block does not exceed 60 symbols. Optionally, an additional whitespace separated cumulative residue count may follow the sequence symbols. Optionally, a block may be followed by a line depicting the degree of conservation of the respective alignment columns.

#### Note

Sequence names and the sequences must not contain whitespace characters! Allowed gap symbols are the hyphen ("-"), and dot (".").

## Warning

Please note that many programs that output this format tend to truncate the sequence names to a limited number of characters, for instance the first 15 characters. This can destroy the uniqueness of identifiers in your MSA.

Here is an example alignment in ClustalW format:

### 9.1.4 MAF format

The multiple alignment format (MAF) is usually used to store multiple alignments on DNA level between entire genomes. It consists of independent blocks of aligned sequences which are annotated by their genomic location. Consequently, an MAF formatted MSA file may contain multiple records. MAF files start with a line

```
##maf
```

which is optionally extended by whitespace delimited key=value pairs. Lines starting with the character("#") are considered comments and usually ignored.

A MAF block starts with character("a") at the beginning of a line, optionally followed by whitespace delimited key=value pairs. The next lines start with character("s") and contain sequence information of the form

```
s src start size strand srcSize sequence
```

where

- *src* is the name of the sequence source
- *start* is the start of the aligned region within the source (0-based)
- *size* is the length of the aligned region without gap characters
- *strand* is either ("+") or ("-"), depicting the location of the aligned region relative to the source
- *srcSize* is the size of the entire sequence source, e.g. the full chromosome
- *sequence* is the aligned sequence including gaps depicted by the hyphen ("-")

Here is an example alignment in MAF format (bluntly taken from the [UCSC Genome browser website](#)):

```

## 9.2 File formats to manipulate the RNA folding grammar

### 9.2.1 Command Files

The RNAlib and many programs of the ViennaRNA Package can parse and apply data from so-called command files. These commands may refer to structure constraints or even extensions of the RNA folding grammar (such as [Unstructured domains](#)). Commands are given as a line of whitespace delimited data fields. The syntax we use extends the constraint definitions used in the [mfold](#) / [UNAFold](#) software, where each line begins with a command character followed by a set of positions.

However, we introduce several new commands, and allow for an optional loop type context specifier in form of a sequence of characters, and an orientation flag that enables one to force a nucleotide to pair upstream, or downstream.

#### 9.2.1.1 Constraint commands

The following set of commands is recognized:

- F ... Force
- P ... Prohibit
- C ... Conflicts/Context dependency
- A ... Allow (for non-canonical pairs)
- E ... Soft constraints for unpaired position(s), or base pair(s)

#### 9.2.1.2 RNA folding grammar extensions

- UD ... Add ligand binding using the [Unstructured domains](#) feature

### 9.2.1.3 Specification of the loop type context

The optional loop type context specifier [LOOP] may be a combination of the following:

- E . . . Exterior loop
- H . . . Hairpin loop
- I . . . Interior loop
- M . . . Multibranch loop
- A . . . All loops

For structure constraints, we additionally allow one to address base pairs enclosed by a particular kind of loop, which results in the specifier [WHERE] which consists of [LOOP] plus the following character:

- i . . . enclosed pair of an Interior loop
- m . . . enclosed pair of a Multibranch loop

If no [LOOP] or [WHERE] flags are set, all contexts are considered (equivalent to A )

### 9.2.1.4 Controlling the orientation of base pairing

For particular nucleotides that are forced to pair, the following [ORIENTATION] flags may be used:

- U . . . Upstream
- D . . . Downstream

If no [ORIENTATION] flag is set, both directions are considered.

### 9.2.1.5 Sequence coordinates

Sequence positions of nucleotides/base pairs are 1– based and consist of three positions  $i$ ,  $j$ , and  $k$ . Alternatively, four positions may be provided as a pair of two position ranges  $[i : j]$ , and  $[k : l]$  using the '-' sign as delimiter within each range, i.e.  $i - j$ , and  $k - l$ .

## 9.2.1.6 Valid constraint commands

Below are resulting general cases that are considered *valid* constraints:

## 1. "Forcing a range of nucleotide positions to be paired":

Syntax:

```
F i 0 k [WHERE] [ORIENTATION]
```

Description:

Enforces the set of  $k$  consecutive nucleotides starting at position  $i$  to be paired. The optional loop type specifier [WHERE] allows to force them to appear as closing/enclosed pairs of certain types of loops.

## 2. "Forcing a set of consecutive base pairs to form":

Syntax:

```
F i j k [WHERE]
```

Description:

Enforces the base pairs  $(i, j), \dots, (i + (k - 1), j - (k - 1))$  to form. The optional loop type specifier [WHERE] allows to specify in which loop context the base pair must appear.

## 3. "Prohibiting a range of nucleotide positions to be paired":

Syntax:

```
P i 0 k [WHERE]
```

Description:

Prohibit a set of  $k$  consecutive nucleotides to participate in base pairing, i.e. make these positions unpaired. The optional loop type specifier [WHERE] allows to force the nucleotides to appear within the loop of specific types.

## 4. "Prohibiting a set of consecutive base pairs to form":

Syntax:

```
P i j k [WHERE]
```

Description:

Prohibit the base pairs  $(i, j), \dots, (i + (k - 1), j - (k - 1))$  to form. The optional loop type specifier [WHERE] allows to specify the type of loop they are disallowed to be the closing or an enclosed pair of.

## 5. "Prohibiting two ranges of nucleotides to pair with each other":

Syntax:

```
P i-j k-l [WHERE]
```

Description:

Prohibit any nucleotide  $p \in [i : j]$  to pair with any other nucleotide  $q \in [k : l]$ . The optional loop type specifier [WHERE] allows to specify the type of loop they are disallowed to be the closing or an enclosed pair of.

## 6. "Enforce a loop context for a range of nucleotide positions":

Syntax:

```
C i 0 k [WHERE]
```

Description:

This command enforces nucleotides to be unpaired similar to *prohibiting* nucleotides to be paired, as described above. It too marks the corresponding nucleotides to be unpaired, however, the [WHERE] flag can be used to enforce specific loop types the nucleotides must appear in.

## 7. "Remove pairs that conflict with a set of consecutive base pairs":

Syntax:

C i j k

Description:

Remove all base pairs that conflict with a set of consecutive base pairs  $(i, j), \dots, (i + (k - 1), j - (k - 1))$ .Two base pairs  $(i, j)$  and  $(p, q)$  conflict with each other if  $i < p < j < q$ , or  $p < i < q < j$ .

## 8. "Allow a set of consecutive (non-canonical) base pairs to form":

Syntax:

A i j k [WHERE]

Description:

This command enables the formation of the consecutive base pairs  $(i, j), \dots, (i + (k - 1), j - (k - 1))$ , no matter if they are *canonical*, or *non-canonical*. In contrast to the above  $\mathbb{F}$  and  $\mathbb{W}$  commands, which remove conflicting base pairs, the  $\mathbb{A}$  command does not. Therefore, it may be used to allow *non-canonical* base pair interactions. Since the RNAlib does not contain free energy contributions  $E_{ij}$  for non-canonical base pairs  $(i, j)$ , they are scored as the *maximum* of similar, known contributions. In terms of a *Nussinov* like scoring function the free energy of non-canonical base pairs is therefore estimated as

$$E_{ij} = \min \left[ \max_{(i,k) \in \{GC, CG, AU, UA, GU, UG\}} E_{ik}, \max_{(k,j) \in \{GC, CG, AU, UA, GU, UG\}} E_{kj} \right].$$

The optional loop type specifier [WHERE] allows to specify in which loop context the base pair may appear.

## 9. "Apply pseudo free energy to a range of unpaired nucleotide positions":

Syntax:

E i 0 k e

Description:

Use this command to apply a pseudo free energy of  $e$  to the set of  $k$  consecutive nucleotides, starting at position  $i$ . The pseudo free energy is applied only if these nucleotides are considered unpaired in the recursions, or evaluations, and is expected to be given in *kcal/mol*.

## 10. "Apply pseudo free energy to a set of consecutive base pairs":

Syntax

E i j k e

Use this command to apply a pseudo free energy of  $e$  to the set of base pairs  $(i, j), \dots, (i + (k - 1), j - (k - 1))$ . Energies are expected to be given in *kcal/mol*.

## 9.2.1.7 Valid domain extensions commands

## 1. "Add ligand binding to unpaired motif (a.k.a. unstructured domains)":

Syntax:

UD m e [LOOP]

Description:

Add ligand binding to unpaired sequence motif  $m$  (given in IUPAC format, capital letters) with binding energy  $e$  in particular loop type(s).

Example:

```
UD  AAA  -5.0  A
```

The above example applies a binding free energy of  $-5kcal/mol$  for a motif AAA that may be present in all loop types.

## Chapter 10

# RNA Structure Notations

### 10.1 Common Notations for RNA secondary structures

#### 10.1.1 Dot-Bracket Notation (a.k.a. Dot-Parenthesis Notation)

The Dot-Bracket notation as introduced already in the early times of the ViennaRNA Package denotes base pairs by matching pairs of parenthesis ( ) and unpaired nucleotides by dots . .

Example: A simple helix of size 4 enclosing a hairpin of size 4 is annotated as

```
(((((....)))))
```

See also

[vrna\\_ptable\\_from\\_string\(\)](#), [vrna\\_db\\_flatten\(\)](#), [vrna\\_db\\_flatten\\_to\(\)](#)

#### 10.1.2 Extended Dot-Bracket Notation

A more generalized version of the original Dot-Bracket notation may use additional pairs of brackets, such as <>, {}, and [], and matching pairs of uppercase/lowercase letters. This allows for anoting pseudo-knots, since different pairs of brackets are not required to be nested.

Example: The follwing annotations of a simple structure with two crossing helices of size 4 are equivalent:

```
<<<<[[[ [. . . >>>]]]]  
((( (AAA . . . )))) aaaa  
AAAA{ {{ { . . . aaaa } } }
```

### 10.1.3 Washington University Secondary Structure (WUSS) notation

The WUSS notation, as frequently used for consensus secondary structures in [Stockholm 1.0 format](#) allows for a fine-grained annotation of base pairs and unpaired nucleotides, including pseudo-knots.

Below, you'll find a list of secondary structure elements and their corresponding WUSS annotation (See also the [infernal user guide at `http://eddylab.org/infernal/Userguide.pdf`](http://eddylab.org/infernal/Userguide.pdf))

- **Base pairs**

Nested base pairs are annotated by matching pairs of the symbols `<>`, `()`, `{}`, and `[]`. Each of the matching pairs of parenthesis have their special meaning, however, when used as input in our programs, e.g. structure constraint, these details are usually ignored. Furthermore, base pairs that constitute as pseudo-knot are denoted by letters from the latin alphabet and are, if not denoted otherwise, ignored entirely in our programs.

- **Hairpin loops**

Unpaired nucleotides that constitute the hairpin loop are indicated by underscores, `_`.

Example: `<<<<<_____>>>>>`

- **Bulges and interior loops**

Residues that constitute a bulge or interior loop are denoted by dashes, `-`.

Example: `(( (-<<_____>>-) ))`

- **Multibranch loops**

Unpaired nucleotides in multibranch loops are indicated by commas, `,`.

Example: `(( („<<_____>>, <<_____>> ) ) )`

- **External residues**

Single stranded nucleotides in the exterior loop, i.e. not enclosed by any other pair are denoted by colons, `:`.

Example: `<<<_____>>>:::`

- **Insertions**

In cases where an alignment represents the consensus with a known structure, insertions relative to the known structure are denoted by periods, `.`. Regions where local structural alignment was invoked, leaving regions of both target and query sequence unaligned, are indicated by tildes, `~`.

**Note**

These symbols only appear in alignments of a known (query) structure annotation to a target sequence of unknown structure.

- **Pseudo-knots**

The WUSS notation allows for annotation of pseudo-knots using pairs of upper-case/lower-case letters.

**Note**

Our programs and library functions usually ignore pseudo-knots entirely treating them as unpaired nucleotides, if not stated otherwise.

Example: `<<<_AAA____>>>aaa`

## Examples

### 11.1 Example programs using the RNAlib C library

#### 11.1.1 Using the 'old' API

The following program exercises most commonly used functions of the library. The program folds two sequences using both the mfe and partition function algorithms and calculates the tree edit and profile distance of the resulting structures and base pairing probabilities.

##### Note

This program uses the old API of RNAlib, which is in part already marked deprecated. Please consult the [RNAlib API v3.0](#) page for details of what changes are necessary to port your implementation to the new API.

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>
#include <string.h>
#include "utils.h"
#include "fold_vars.h"
#include "fold.h"
#include "part_func.h"
#include "inverse.h"
#include "RNAstruct.h"
#include "treedist.h"
#include "stringdist.h"
#include "profiledist.h"

void main()
{
    char *seq1="CGCAGGGGAUACCCGCG", *seq2="GCGCCCAUAGGGACGC",
        *struct1,* struct2,* xstruc;
    float e1, e2, tree_dist, string_dist, profile_dist, kT;
    Tree *T1, *T2;
    swString *S1, *S2;
    float *pf1, *pf2;
    FLT_OR_DBL *bppm;
    /* fold at 30C instead of the default 37C */
    temperature = 30.;          /* must be set *before* initializing */

    /* allocate memory for structure and fold */
    struct1 = (char* ) space(sizeof(char)*(strlen(seq1)+1));
    e1 = fold(seq1, struct1);

    struct2 = (char* ) space(sizeof(char)*(strlen(seq2)+1));
    e2 = fold(seq2, struct2);

    free_arrays();              /* free arrays used in fold() */

    /* produce tree and string representations for comparison */
    xstruc = expand_Full(struct1);
    T1 = make_tree(xstruc);
```

```

S1 = Make_swString(xstruc);
free(xstruc);

xstruc = expand_Full(struct2);
T2 = make_tree(xstruc);
S2 = Make_swString(xstruc);
free(xstruc);

/* calculate tree edit distance and aligned structures with gaps */
edit_backtrack = 1;
tree_dist = tree_edit_distance(T1, T2);
free_tree(T1); free_tree(T2);
unexpand_aligned_F(aligned_line);
printf("%s\n%s  %3.2f\n", aligned_line[0], aligned_line[1], tree_dist);

/* same thing using string edit (alignment) distance */
string_dist = string_edit_distance(S1, S2);
free(S1); free(S2);
printf("%s mfe=%5.2f\n%s mfe=%5.2f dist=%3.2f\n",
       aligned_line[0], e1, aligned_line[1], e2, string_dist);

/* for longer sequences one should also set a scaling factor for
   partition function folding, e.g: */
kT = (temperature+273.15)*1.98717/1000.; /* kT in kcal/mol */
pf_scale = exp(-e1/kT/strlen(seq1));

/* calculate partition function and base pair probabilities */
e1 = pf_fold(seq1, struct1);
/* get the base pair probability matrix for the previous run of pf_fold() */
bppm = export_bppm();
pf1 = Make_bp_profile_bppm(bppm, strlen(seq1));

e2 = pf_fold(seq2, struct2);
/* get the base pair probability matrix for the previous run of pf_fold() */
bppm = export_bppm();
pf2 = Make_bp_profile_bppm(bppm, strlen(seq2));

free_pf_arrays(); /* free space allocated for pf_fold() */

profile_dist = profile_edit_distance(pf1, pf2);
printf("%s free energy=%5.2f\n%s free energy=%5.2f dist=%3.2f\n",
       aligned_line[0], e1, aligned_line[1], e2, profile_dist);

free_profile(pf1); free_profile(pf2);
}

```

In a typical Unix environment you would compile this program using:

```
cc ${OPENMP_CFLAGS} -c example.c -I${hpath}
```

and link using

```
cc ${OPENMP_CFLAGS} -o example -L${lpath} -lRNA -lm
```

where `${hpath}` and `${lpath}` point to the location of the header files and library, respectively.

#### Note

As default, the RNAlib is compiled with build-in *OpenMP* multithreading support. Thus, when linking your own object files to the library you have to pass the compiler specific `${OPENMP_CFLAGS}` (e.g. `-fopenmp` for **gcc**) even if your code does not use openmp specific code. However, in that case the *OpenMP* flags may be omitted when compiling `example.c`

### 11.1.2 Using the 'new' v3.0 API

The following is a simple program that computes the MFE, partition function, and centroid structure by making use of the v3.0 API.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#include <ViennaRNA/data_structures.h>
#include <ViennaRNA/params.h>
#include <ViennaRNA/utils.h>
#include <ViennaRNA/eval.h>
#include <ViennaRNA/fold.h>
#include <ViennaRNA/part_func.h>

int main(int argc, char *argv[]){

    char *seq = "
    AGACGACAAGGUUGAAUCGCACCCACAGUCUAUGAGUCGGUGACAACAUUACGAAAGGCUGUAAAAUCAUUUAUUCACCACAGGGGGCCCCGUGUCUAG";
    char *mfe_structure = vrna_alloc(sizeof(char) * (strlen(seq) + 1));
    char *prob_string = vrna_alloc(sizeof(char) * (strlen(seq) + 1));

    /* get a vrna_fold_compound with default settings */
    vrna_fold_compound_t *vc = vrna_fold_compound(seq, NULL,
        VRNA_OPTION_DEFAULT);

    /* call MFE function */
    double mfe = (double)vrna_mfe(vc, mfe_structure);

    printf("%s\n%s (%6.2f)\n", seq, mfe_structure, mfe);

    /* rescale parameters for Boltzmann factors */
    vrna_exp_params_rescale(vc, &mfe);

    /* call PF function */
    FLT_OR_DBL en = vrna_pf(vc, prob_string);

    /* print probability string and free energy of ensemble */
    printf("%s (%6.2f)\n", prob_string, en);

    /* compute centroid structure */
    double dist;
    char *cent = vrna_centroid(vc, &dist);

    /* print centroid structure, its free energy and mean distance to the ensemble */
    printf("%s (%6.2f d=%6.2f)\n", cent, vrna_eval_structure(vc, cent), dist);

    /* free centroid structure */
    free(cent);

    /* free pseudo dot-bracket probability string */
    free(prob_string);

    /* free mfe structure */
    free(mfe_structure);

    /* free memory occupied by vrna_fold_compound */
    vrna_fold_compound_free(vc);

    return EXIT_SUCCESS;
}
```

## 11.2 Perl Examples

### 11.2.1 Using the Flat Interface

Example 1: "Simple MFE prediction"

```
#!/usr/bin/perl

use warnings;
use strict;
```

```

use RNA;

my $seq1 = "CGCAGGGGAUACCCGCG";

# compute minimum free energy (mfe) and corresponding structure
my ($ss, $mfe) = RNA::fold($seq1);

# print output
printf "%s [ %6.2f ]\n", $ss, $mfe;

```

## 11.2.2 Using the Object Oriented (OO) Interface

The 'fold\_compound' class that serves as an object oriented interface for [vrna\\_fold\\_compound\\_t](#)

Example 1: "Simple MFE prediction"

```

#!/usr/bin/perl

use warnings;
use strict;

use RNA;

my $seq1 = "CGCAGGGGAUACCCGCG";

# create new fold_compound object
my $fc = new RNA::fold_compound($seq1);

# compute minimum free energy (mfe) and corresponding structure
my ($ss, $mfe) = $fc->mfe();

# print output
printf "%s [ %6.2f ]\n", $ss, $mfe;

```

## 11.3 Python Examples

### 11.3.1 Using the Flat Interface

Example 1: "Simple MFE prediction"

```

# compute minimum free energy (mfe) and corresponding structure
(ss, mfe) = fc.mfe()

# print output
print "%s [ %6.2f ]" % (ss, mfe)
```

### Example 2: "Use callback while generating suboptimal structures"

```
import RNA

sequence = "GGGGAAAACCCC"

# Set global switch for unique ML decomposition
RNA.cvar.uniq_ML = 1

subopt_data = { 'counter' : 1, 'sequence' : sequence }

# Print a subopt result as FASTA record
def print_subopt_result(structure, energy, data):
    if not structure == None:
        print ">subopt %d" % data['counter']
        print "%s" % data['sequence']
        print "%s [%6.2f]" % (structure, energy)
        # increase structure counter
        data['counter'] = data['counter'] + 1

# Create a 'fold_compound' for our sequence
a = RNA.fold_compound(sequence)

# Enumerate all structures 500 dcal/mol = 5 kcal/mol around
# the MFE and print each structure using the function above
a.subopt_cb(500, print_subopt_result, subopt_data);
```

### Example 3: "Revert MFE to Maximum Matching using soft constraint callbacks"

```

## Chapter 12

# Deprecated List

Global **alifold** (const char \*\*strings, char \*structure)

Usage of this function is discouraged! Use [vrna\\_alifold\(\)](#), or [vrna\\_mfe\(\)](#) instead!

Global **alimake\_pair\_table** (const char \*structure)

Use [vrna\\_pt\\_ali\\_get\(\)](#) instead!

Global **alipbacktrack** (double \*prob)

Use [vrna\\_pbacktrack\(\)](#) instead!

Global **alipf\_circ\_fold** (const char \*\*sequences, char \*structure, vrna\_ep\_t \*\*pl)

Use [vrna\\_pf\(\)](#) instead

Global **alipf\_fold** (const char \*\*sequences, char \*structure, vrna\_ep\_t \*\*pl)

Use [vrna\\_pf\(\)](#) instead

Global **alipf\_fold\_par** (const char \*\*sequences, char \*structure, vrna\_ep\_t \*\*pl, vrna\_exp\_param\_t \*parameters, int calculate\_bppm, int is\_constrained, int is\_circular)

Use [vrna\\_pf\(\)](#) instead

Global **assign\_plist\_from\_db** (vrna\_ep\_t \*\*pl, const char \*struc, float pr)

Use [vrna\\_plist\(\)](#) instead

Global **assign\_plist\_from\_pr** (vrna\_ep\_t \*\*pl, FLT\_OR\_DBL \*probs, int length, double cutoff)

Use [vrna\\_plist\\_from\\_probs\(\)](#) instead!

Global **base\_pair**

Do not use this variable anymore!

Global **bondT**

Use [vrna\\_bp\\_stack\\_t](#) instead!

Global **bp\_distance** (const char \*str1, const char \*str2)

Use [vrna\\_bp\\_distance](#) instead

Global **bppm\_symbol** (const float \*x)

Use [vrna\\_bpp\\_symbol\(\)](#) instead!

Global **bppm\_to\_structure** (char \*structure, FLT\_OR\_DBL \*pr, unsigned int length)

Use [vrna\\_db\\_from\\_probs\(\)](#) instead!

Global **centroid** (int length, double \*dist)

This function is deprecated and should not be used anymore as it is not threadsafe!

Global **circalifold** (const char \*\*strings, char \*structure)

Usage of this function is discouraged! Use [vrna\\_alicircfold\(\)](#), and [vrna\\_mfe\(\)](#) instead!

Global **circfold** (const char \*sequence, char \*structure)

Use [vrna\\_circfold\(\)](#), or [vrna\\_mfe\(\)](#) instead!

Global **co\_pf\_fold** (char \*sequence, char \*structure)

{Use [vrna\\_pf\\_dimer\(\)](#) instead!}

Global **co\_pf\_fold\_par** (char \*sequence, char \*structure, vrna\_exp\_param\_t \*parameters, int calculate\_bp↵  
bpm, int is\_constrained)

Use [vrna\\_pf\\_dimer\(\)](#) instead!

Global **cofold** (const char \*sequence, char \*structure)

use [vrna\\_mfe\\_dimer\(\)](#) instead

Global **cofold\_par** (const char \*string, char \*structure, vrna\_param\_t \*parameters, int is\_constrained)

use [vrna\\_mfe\\_dimer\(\)](#) instead

Global **compute\_BPdifferences** (short \*pt1, short \*pt2, unsigned int turn)

Use [vrna\\_refBPdist\\_matrix\(\)](#) instead

Global **compute\_probabilities** (double FAB, double FEA, double FEB, vrna\_ep\_t \*prAB, vrna\_ep\_t \*prA, vrna\_ep\_t \*prB, int Alength)

{ Use [vrna\\_pf\\_dimer\\_probs\(\)](#) instead!}

Global **constrain\_ptypes** (const char \*constraint, unsigned int length, char \*ptype, int \*BP, int min\_loop↵  
\_size, unsigned int idx\_type)

Do not use this function anymore! Structure constraints are now handled through [vrna\\_hc\\_t](#) and related functions.

Global **copy\_pair\_table** (const short \*pt)

Use [vrna\\_ptable\\_copy\(\)](#) instead

Global **cpair**

Use [vrna\\_cpair\\_t](#) instead!

Global **cv\_fact**

See [vrna\\_md\\_t.cv\\_fact](#), and [vrna\\_mfe\(\)](#) to avoid using global variables

Global **destroy\_TwoDfold\_variables** (TwoDfold\_vars \*our\_variables)

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound↵  
\\_TwoD\(\)](#), [vrna\\_mfe\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

Global **destroy\_TwoDpfold\_variables** (TwoDpfold\_vars \*vars)

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound↵  
\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

Global **energy\_of\_alistruct** (const char \*\*sequences, const char \*structure, int n\_seq, float \*energy)

Usage of this function is discouraged! Use [vrna\\_eval\\_structure\(\)](#), and [vrna\\_eval\\_covar\\_structure\(\)](#) instead!

Global **energy\_of\_circ\_struct** (const char \*string, const char \*structure)

This function is deprecated and should not be used in future programs Use [energy\\_of\\_circ\\_structure\(\)](#) instead!

Global **energy\_of\_circ\_struct\_par** (const char \*string, const char \*structure, vrna\_param\_t \*parameters, int verbosity\_level)

Use [vrna\\_eval\\_structure\(\)](#) or [vrna\\_eval\\_structure\\_verbose\(\)](#) instead!

Global **energy\_of\_circ\_structure** (const char \*string, const char \*structure, int verbosity\_level)

Use [vrna\\_eval\\_structure\(\)](#) or [vrna\\_eval\\_structure\\_verbose\(\)](#) instead!

Global **energy\_of\_move** (const char \*string, const char \*structure, int m1, int m2)

Use [vrna\\_eval\\_move\(\)](#) instead!

Global **energy\_of\_move\_pt** (short \*pt, short \*s, short \*s1, int m1, int m2)

Use [vrna\\_eval\\_move\\_pt\(\)](#) instead!

Global **energy\_of\_struct** (const char \*string, const char \*structure)

This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\(\)](#) instead!

Global **energy\_of\_struct\_par** (const char \*string, const char \*structure, vrna\_param\_t \*parameters, int verbosity\_level)

Use [vrna\\_eval\\_structure\(\)](#) or [vrna\\_eval\\_structure\\_verbose\(\)](#) instead!

Global **energy\_of\_struct\_pt** (const char \*string, short \*ptable, short \*s, short \*s1)

This function is deprecated and should not be used in future programs! Use [energy\\_of\\_structure\\_pt\(\)](#) instead!

Global **energy\_of\_struct\_pt\_par** (const char \*string, short \*ptable, short \*s, short \*s1, vrna\_param\_t \*parameters, int verbosity\_level)

Use [vrna\\_eval\\_structure\\_pt\(\)](#) or [vrna\\_eval\\_structure\\_pt\\_verbose\(\)](#) instead!

Global **energy\_of\_structure** (const char \*string, const char \*structure, int verbosity\_level)

Use [vrna\\_eval\\_structure\(\)](#) or [vrna\\_eval\\_structure\\_verbose\(\)](#) instead!

Global **energy\_of\_structure\_pt** (const char \*string, short \*ptable, short \*s, short \*s1, int verbosity\_level)

Use [vrna\\_eval\\_structure\\_pt\(\)](#) or [vrna\\_eval\\_structure\\_pt\\_verbose\(\)](#) instead!

Global **expHairpinEnergy** (int u, int type, short si1, short sj1, const char \*string)

Use [exp\\_E\\_Hairpin\(\)](#) from [loop\\_energies.h](#) instead

Global **expLoopEnergy** (int u1, int u2, int type, int type2, short si1, short sj1, short sp1, short sq1)

Use [exp\\_E\\_IntLoop\(\)](#) from [loop\\_energies.h](#) instead

Global **export\_ali\_bppm** (void)

Usage of this function is discouraged! The new [vrna\\_fold\\_compound\\_t](#) allows direct access to the folding matrices, including the pair probabilities! The pair probability array returned here reflects the one of the latest call to [vrna\\_pf\(\)](#), or any of the old API calls for consensus structure partition function folding.

Global **export\_circfold\_arrays** (int \*Fc\_p, int \*FcH\_p, int \*FcI\_p, int \*FcM\_p, int \*\*fM2\_p, int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*indx\_p, char \*\*ptype\_p)

See [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **export\_circfold\_arrays\_par** (int \*Fc\_p, int \*FcH\_p, int \*FcI\_p, int \*FcM\_p, int \*\*fM2\_p, int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*indx\_p, char \*\*ptype\_p, vrna\_param\_t \*\*P\_p)

See [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **export\_co\_bppm** (void)

This function is deprecated and will be removed soon! The base pair probability array is available through the [vrna\\_fold\\_compound\\_t](#) data structure, and its associated [vrna\\_mx\\_pf\\_t](#) member.

Global **export\_cofold\_arrays** (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*fc\_p, int \*\*indx\_p, char \*\*ptype\_p)

folding matrices now reside within the [vrna\\_fold\\_compound\\_t](#). Thus, this function will only work in conjunction with a prior call to the deprecated functions [cofold\(\)](#) or [cofold\\_par\(\)](#)

Global **export\_cofold\_arrays\_gg** (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*fc\_p, int \*\*ggg\_p, int \*\*indx\_p, char \*\*ptype\_p)

folding matrices now reside within the fold compound. Thus, this function will only work in conjunction with a prior call to [cofold\(\)](#) or [cofold\\_par\(\)](#)

Global **export\_fold\_arrays** (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*indx\_p, char \*\*ptype\_p)

See [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **export\_fold\_arrays\_par** (int \*\*f5\_p, int \*\*c\_p, int \*\*fML\_p, int \*\*fM1\_p, int \*\*indx\_p, char \*\*ptype\_p, vrna\_param\_t \*\*P\_p)

See [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **filecopy** (FILE \*from, FILE \*to)

Use [vrna\\_file\\_copy\(\)](#) instead!

Global **fold** (const char \*sequence, char \*structure)

use [vrna\\_fold\(\)](#), or [vrna\\_mfe\(\)](#) instead!

Global **fold\_par** (const char \*sequence, char \*structure, vrna\_param\_t \*parameters, int is\_constrained, int is\_circular)

use [vrna\\_mfe\(\)](#) instead!

Global **free\_alifold\_arrays** (void)

Usage of this function is discouraged! It only affects memory being free'd that was allocated by an old API function before. Release of memory occupied by the newly introduced [vrna\\_fold\\_compound\\_t](#) is handled by [vrna\\_vrna\\_fold\\_compound\\_free\(\)](#)

Global **free\_alipf\_arrays** (void)

Usage of this function is discouraged! This function only free's memory allocated by old API function calls. Memory allocated by any of the new API calls (starting with vrna\_) will be not affected!

Global **free\_arrays** (void)

See [vrna\\_fold\(\)](#), [vrna\\_circfold\(\)](#), or [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **free\_co\_arrays** (void)

This function will only free memory allocated by a prior call of [cofold\(\)](#) or [cofold\\_par\(\)](#). See [vrna\\_mfe\\_dimer\(\)](#) for how to use the new API

Global **free\_co\_pf\_arrays** (void)

This function will be removed for the new API soon! See [vrna\\_pf\\_dimer\(\)](#), [vrna\\_fold\\_compound\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) for an alternative

Global **free\_pf\_arrays** (void)

See [vrna\\_fold\\_compound\\_t](#) and its related functions for how to free memory occupied by the dynamic programming matrices

Global **get\_alipf\_arrays** (short \*\*\*S\_p, short \*\*\*S5\_p, short \*\*\*S3\_p, unsigned short \*\*\*a2s\_p, char \*\*\*Ss\_p, FLT\_OR\_DBL \*\*qb\_p, FLT\_OR\_DBL \*\*qm\_p, FLT\_OR\_DBL \*\*q1k\_p, FLT\_OR\_DBL \*\*qln\_p, short \*\*pscore)

It is discouraged to use this function! The new [vrna\\_fold\\_compound\\_t](#) allows direct access to all necessary consensus structure prediction related variables!

Global **get\_boltzmann\_factor\_copy** (vrna\_exp\_param\_t \*parameters)

Use [vrna\\_exp\\_params\\_copy\(\)](#) instead!

Global **get\_boltzmann\_factors** (double temperature, double betaScale, vrna\_md\_t md, double pf\_scale)

Use [vrna\\_exp\\_params\(\)](#) instead!

Global **get\_boltzmann\_factors\_al** (unsigned int n\_seq, double temperature, double betaScale, vrna\_md\_t md, double pf\_scale)

Use [vrna\\_exp\\_params\\_comparative\(\)](#) instead!

Global **get\_centroid\_struct\_gquad\_pr** (int length, double \*dist)

This function is deprecated and should not be used anymore as it is not threadsafe!

Global **get\_centroid\_struct\_pl** (int length, double \*dist, vrna\_ep\_t \*pl)

This function was renamed to [vrna\\_centroid\\_from\\_plist\(\)](#)

Global **get\_centroid\_struct\_pr** (int length, double \*dist, FLT\_OR\_DBL \*pr)

This function was renamed to [vrna\\_centroid\\_from\\_probs\(\)](#)

Global **get\_concentrations** (double FEAB, double FEAA, double FEBB, double FEA, double FEB, double \*startconc)

{ Use [vrna\\_pf\\_dimer\\_concentrations\(\)](#) instead! }

Global **get\_line** (FILE \*fp)

Use [vrna\\_read\\_line\(\)](#) as a substitute!

Global **get\_monomere\_mfes** (float \*e1, float \*e2)

{This function is obsolete and will be removed soon!}

Global **get\_mpi** (char \*Alseq[], int n\_seq, int length, int \*mini)

Use [vrna\\_aln\\_mpi\(\)](#) as a replacement

Global **get\_plist** (vrna\_ep\_t \*pl, int length, double cut\_off)

{ This function is deprecated and will be removed soon!} use [assign\\_plist\\_from\\_pr\(\)](#) instead!

Global **get\_scaled\_alipf\_parameters** (unsigned int n\_seq)

Use [vrna\\_exp\\_params\\_comparative\(\)](#) instead!

Global **get\_scaled\_parameters** (double temperature, vrna\_md\_t md)

Use [vrna\\_params\(\)](#) instead!

Global **get\_scaled\_pf\_parameters** (void)

Use [vrna\\_exp\\_params\(\)](#) instead!

Global **get\_TwoDfold\_variables** (const char \*seq, const char \*structure1, const char \*structure2, int circ)

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound↵\\_TwoD\(\)](#), [vrna\\_mfe\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

Global **get\_TwoDpfold\_variables** (const char \*seq, const char \*structure1, char \*structure2, int circ)

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound↵\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

Global **HairpinE** (int size, int type, int si1, int sj1, const char \*string)

{This function is deprecated and will be removed soon. Use [E\\_Hairpin\(\)](#) instead!}

Global **hamming** (const char \*s1, const char \*s2)

Use [vrna\\_hamming\\_distance\(\)](#) instead!

Global **hamming\_bound** (const char \*s1, const char \*s2, int n)

Use [vrna\\_hamming\\_distance\\_bound\(\)](#) instead!

Global **iindx**

Do not use this variable anymore!

Global **init\_co\_pf\_fold** (int length)

{ This function is deprecated and will be removed soon!}

Global **init\_pf\_fold** (int length)

This function is obsolete and will be removed soon!

Global **init\_rand** (void)

Use [vrna\\_init\\_rand\(\)](#) instead!

Global **initialize\_cofold** (int length)

{This function is obsolete and will be removed soon!}

Global **initialize\_fold** (int length)

See [vrna\\_mfe\(\)](#) and [vrna\\_fold\\_compound\\_t](#) for the usage of the new API!

Global **int\_urn** (int from, int to)

Use [vrna\\_int\\_urn\(\)](#) instead!

Global **Lfold** (const char \*string, char \*structure, int maxdist)

Use [vrna\\_mfe\\_window\(\)](#) instead!

Global **Lfoldz** (const char \*string, char \*structure, int maxdist, int zsc, double min\_z)

Use [vrna\\_mfe\\_window\\_zscore\(\)](#) instead!

Global **loop\_energy** (short \*ptable, short \*s, short \*s1, int i)

Use [vrna\\_eval\\_loop\\_pt\(\)](#) instead!

Global **LoopEnergy** (int n1, int n2, int type, int type\_2, int si1, int sj1, int sp1, int sq1)

{This function is deprecated and will be removed soon. Use [E\\_IntLoop\(\)](#) instead!}

Global **Make\_bp\_profile** (int length)

This function is deprecated and will be removed soon! See [Make\\_bp\\_profile\\_bppm\(\)](#) for a replacement

Global **make\_pair\_table** (const char \*structure)

Use [vrna\\_ptable\(\)](#) instead

Global **make\_pair\_table\_snoop** (const char \*structure)

Use [vrna\\_pt\\_snoop\\_get\(\)](#) instead!

Global **make\_referenceBP\_array** (short \*reference\_pt, unsigned int turn)

Use [vrna\\_refBPcnt\\_matrix\(\)](#) instead

Global **mean\_bp\_dist** (int length)

This function is not threadsafe and should not be used anymore. Use [mean\\_bp\\_distance\(\)](#) instead!

Global **mean\_bp\_distance** (int length)

Use [vrna\\_mean\\_bp\\_distance\(\)](#) or [vrna\\_mean\\_bp\\_distance\\_pr\(\)](#) instead!

Global **mean\_bp\_distance\_pr** (int length, FLT\_OR\_DBL \*pr)

Use [vrna\\_mean\\_bp\\_distance\(\)](#) or [vrna\\_mean\\_bp\\_distance\\_pr\(\)](#) instead!

Global **nc\_fact**

See [vrna\\_md\\_t.nc\\_fact](#), and [vrna\\_mfe\(\)](#) to avoid using global variables

Global **nrerror** (const char message[])

Use [vrna\\_message\\_error\(\)](#) instead!

Global **pack\_structure** (const char \*struc)

Use [vrna\\_db\\_pack\(\)](#) as a replacement

Global **PAIR**

Use [vrna\\_basepair\\_t](#) instead!

Global **pair\_info**

Use [vrna\\_pinfo\\_t](#) instead!

Global **paramT**

Use [vrna\\_param\\_t](#) instead!

Global **parenthesis\_structure** (char \*structure, vrna\_bp\_stack\_t \*bp, int length)

use [vrna\\_parenthesis\\_structure\(\)](#) instead

Global **parenthesis\_zuker** (char \*structure, vrna\_bp\_stack\_t \*bp, int length)

use [vrna\\_parenthesis\\_zuker](#) instead

Global **path\_t**

Use [vrna\\_path\\_t](#) instead!

Global **pbacktrack\_circ** (char \*sequence)

Use [vrna\\_pbacktrack\(\)](#) instead.

Global **pf\_circ\_fold** (const char \*sequence, char \*structure)

Use [vrna\\_pf\(\)](#) instead!

Global **pf\_fold\_par** (const char \*sequence, char \*structure, vrna\_exp\_param\_t \*parameters, int calculate↵  
\_bppm, int is\_constrained, int is\_circular)

Use [vrna\\_pf\(\)](#) instead

Global **pf\_paramT**

Use [vrna\\_exp\\_param\\_t](#) instead!

Global **plist**

Use [vrna\\_ep\\_t](#) or [vrna\\_elem\\_prob\\_s](#) instead!

Global **pr**

Do not use this variable anymore!

Global **print\_tty\_constraint** (unsigned int option)

Use [vrna\\_message\\_constraints\(\)](#) instead!

**Global `print_tty_constraint_full` (void)**

Use `vrna_message_constraint_options_all()` instead!

**Global `print_tty_input_seq` (void)**

Use `vrna_message_input_seq_simple()` instead!

**Global `print_tty_input_seq_str` (const char \*s)**

Use `vrna_message_input_seq()` instead!

**Global `PS_dot_plot` (char \*string, char \*file)**

This function is deprecated and will be removed soon! Use `PS_dot_plot_list()` instead!

**Global `PS_rna_plot` (char \*string, char \*structure, char \*file)**

Use `vrna_file_PS_rnaplot()` instead!

**Global `PS_rna_plot_a` (char \*string, char \*structure, char \*file, char \*pre, char \*post)**

Use `vrna_file_PS_rnaplot_a()` instead!

**Global `PS_rna_plot_a_gquad` (char \*string, char \*structure, char \*ssfile, char \*pre, char \*post)**

Use `vrna_file_PS_rnaplot_a()` instead!

**Global `random_string` (int l, const char symbols[])**

Use `vrna_random_string()` instead!

**Global `read_record` (char \*\*header, char \*\*sequence, char \*\*\*rest, unsigned int options)**

This function is deprecated! Use `vrna_file_fasta_read_record()` as a replacement.

**Global `scale_parameters` (void)**

Use `vrna_params()` instead!

**Global `sect`**

Use `vrna_sect_t` instead!

**Global `set_model_details` (vrna\_md\_t \*md)**

This function will vanish as soon as backward compatibility of RNAlib is dropped (expected in version 3). Use `vrna_md_set_default()` instead!

**Global `SOLUTION`**

Use `vrna_subopt_solution_t` instead!

**Global `space` (unsigned size)**

Use `vrna_alloc()` instead!

**Global `st_back`**

set the `uniq_ML` flag in `vrna_md_t` before passing it to `vrna_fold_compound()`.

**Global `stackProb` (double cutoff)**

Use `vrna_stack_prob()` instead!

**Global `str_DNA2RNA` (char \*sequence)**

Use `vrna_seq_toRNA()` instead!

**Global `str_uppercase` (char \*sequence)**

Use `vrna_seq_toupper()` instead!

**Global `temperature`**

Use `vrna_md_defaults_temperature()`, and `vrna_md_defaults_temperature_get()` to change, and read the global default temperature settings

**Global `time_stamp` (void)**

Use `vrna_time_stamp()` instead!

**Global `TwoDfold_backtrack_f5` (unsigned int j, int k, int l, `TwoDfold_vars` \*vars)**

Use the new API that relies on `vrna_fold_compound_t` and the corresponding functions `vrna_fold_compound`↔`_TwoD()`, `vrna_mfe_TwoD()`, `vrna_backtrack5_TwoD()`, and `vrna_fold_compound_free()` instead!

**Global [TwoDfold\\_vars](#)**

This data structure will be removed from the library soon! Use [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_mfe\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

**Global [TwoDfoldList](#) ([TwoDfold\\_vars](#) \*vars, int distance1, int distance2)**

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_mfe\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

**Global [TwoDpfold\\_pbacktrack](#) ([TwoDpfold\\_vars](#) \*vars, int d1, int d2)**

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), [vrna\\_pbacktrack\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

**Global [TwoDpfold\\_pbacktrack5](#) ([TwoDpfold\\_vars](#) \*vars, int d1, int d2, unsigned int length)**

Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), [vrna\\_pbacktrack5\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

**Class [TwoDpfold\\_vars](#)**

This data structure will be removed from the library soon! Use [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

# Bug List

### Module [domains\\_up](#)

Although the additional production rule(s) for unstructured domains in the descriptions of this feature are always treated as 'segments possibly bound to one or more ligands', the current implementation requires that at least one ligand is bound. The default implementation already takes care of the required changes, however, upon using callback functions other than the default ones, one has to take care of this fact. Please also note, that this behavior might change in one of the next releases, such that the decomposition schemes as shown above comply with the actual implementation.

### Global [vrna\\_subopt\\_zuker](#) ([vrna\\_fold\\_compound\\_t](#) \*vc)

Due to resizing, any pre-existing constraints will be lost!

### 17.1.1 Detailed Description

Secondary structure and loop free energy evaluation.

Functions and variables related to free energy evaluation of sequence/structure pairs.

This module covers the functions to evaluate the free energy of a secondary structure given its sequence.

Each base pair in a secondary structure closes a loop, thereby directly enclosing unpaired nucleotides, and/or further base pairs. Our implementation distinguishes four basic types of loops:

- hairpin loops
- interior loops
- multibranch loops
- exterior loop

While the exterior loop is a special case without a closing pair, the other loops are determined by the number of base pairs involved in the loop formation, i.e. hairpin loops are 1-loops, since only a single base pair delimits the loop. Interior loops are 2-loops due to their enclosing, and enclosed base pair. All loops where more than two base pairs are involved, are termed multibranch loops.

Any secondary structure can be decomposed into its loops. Each of the loops then can be scored in terms of free energy, and the free energy of an entire secondary structure is simply the sum of free energies of its loops.

## 17.1.2 Function Documentation

### 17.1.2.1 `vrna_eval_structure()`

```
float vrna_eval_structure (
    vrna_fold_compound_t * vc,
    const char * structure )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA.

This function allows for energy evaluation of a given pair of structure and sequence (alignment). Model details, energy parameters, and possibly soft constraints are used as provided via the parameter 'vc'. The `vrna_fold_compound_t` does not need to contain any DP matrices, but requires all most basic init values as one would get from a call like this:

```
vc = vrna_fold_compound(sequence, NULL, VRNA_OPTION_EVAL_ONLY);
```

#### Note

Accepts `vrna_fold_compound_t` of type `VRNA_FC_TYPE_SINGLE` and `VRNA_FC_TYPE_COMPARATIVE`

#### Parameters

<code>vc</code>	A <code>vrna_fold_compound_t</code> containing the energy parameters and model details
<code>structure</code>	Secondary structure in dot-bracket notation

**Returns**

The free energy of the input structure given the input sequence in kcal/mol

**SWIG Wrapper Notes** This function is attached as method **eval\_structure()** to objects of type *fold\_compound*

**17.1.2.2 vrna\_eval\_covar\_structure()**

```
float vrna_eval_covar_structure (
    vrna_fold_compound_t * vc,
    const char * structure )

#include <ViennaRNA/eval.h>
```

Calculate the pseudo energy derived by the covariance scores of a set of aligned sequences.

Consensus structure prediction is driven by covariance scores of base pairs in rows of the provided alignment. This function allows one to retrieve the total amount of this covariance pseudo energy scores. The *vrna\_fold\_compound\_t* does not need to contain any DP matrices, but requires all most basic init values as one would get from a call like this:

```
vc = vrna_fold_compound_comparative(alignment, NULL,
    VRNA_OPTION_EVAL_ONLY);
```

**Note**

Accepts *vrna\_fold\_compound\_t* of type **VRNA\_FC\_TYPE\_COMPARATIVE** only!

**See also**

**Parameters**

<i>vc</i>	A <i>vrna_fold_compound_t</i> containing the energy parameters and model details
<i>structure</i>	Secondary (consensus) structure in dot-bracket notation

**Returns**

The covariance pseudo energy score of the input structure given the input sequence alignment in kcal/mol

**SWIG Wrapper Notes** This function is attached as method **eval\_covar\_structure()** to objects of type *fold\_compound*

17.1.2.3 `vrna_eval_structure_simple()`

```
float vrna_eval_structure_simple (
    const char * string,
    const char * structure )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA.

This function allows for energy evaluation of a given sequence/structure pair. In contrast to `vrna_eval_structure()` this function assumes default model details and default energy parameters in order to evaluate the free energy of the secondary structure. Therefore, it serves as a simple interface function for energy evaluation for situations where no changes on the energy model are required.

## Parameters

<i>string</i>	RNA sequence in uppercase letters
<i>structure</i>	Secondary structure in dot-bracket notation

## Returns

The free energy of the input structure given the input sequence in kcal/mol

17.1.2.4 `vrna_eval_structure_verbose()`

```
float vrna_eval_structure_verbose (
    vrna_fold_compound_t * vc,
    const char * structure,
    FILE * file )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA and print contributions on a per-loop base.

This function is a simplified version of `vrna_eval_structure_v()` that uses the *default* verbosity level. (

## Parameters

<i>vc</i>	A <code>vrna_fold_compound_t</code> containing the energy parameters and model details
<i>structure</i>	Secondary structure in dot-bracket notation
<i>file</i>	A file handle where this function should print to (may be NULL).

**Returns**

The free energy of the input structure given the input sequence in kcal/mol

**SWIG Wrapper Notes** This function is attached as method **eval\_structure\_verbose()** to objects of type *fold\_compound*

**17.1.2.5 vrna\_eval\_structure\_v()**

```
float vrna_eval_structure_v (
    vrna_fold_compound_t * vc,
    const char * structure,
    int verbosity_level,
    FILE * file )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA and print contributions on a per-loop base.

This function allows for detailed energy evaluation of a given sequence/structure pair. In contrast to [vrna\\_eval\\_structure\(\)](#) this function prints detailed energy contributions based on individual loops to a file handle. If NULL is passed as file handle, this function defaults to print to stdout. Any positive `verbosity_level` activates potential warning message of the energy evaluating functions, while values  $\geq 1$  allow for detailed control of what data is printed. A negative parameter `verbosity_level` turns off printing all together.

Model details, energy parameters, and possibly soft constraints are used as provided via the parameter 'vc'. The `fold_compound` does not need to contain any DP matrices, but all the most basic init values as one would get from a call like this:

```
vc = vrna_fold_compound(sequence, NULL, VRNA_OPTION_EVAL_ONLY);
```

<i>structure</i>	Secondary structure in dot-bracket notation
<i>verbosity_level</i>	The level of verbosity of this function
<i>file</i>	A file handle where this function should print to (may be NULL).

**Returns**

The free energy of the input structure given the input sequence in kcal/mol

### 17.1.2.6 `vrna_eval_structure_simple_verbose()`

```
float vrna_eval_structure_simple_verbose (
    const char * string,
    const char * structure,
    FILE * file )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA and print contributions per loop.

This function is a simplified version of `vrna_eval_structure_simple_v()` that uses the *default* verbosity level.

## Parameters

<i>string</i>	RNA sequence in uppercase letters
<i>structure</i>	Secondary structure in dot-bracket notation
<i>verbosity_level</i>	The level of verbosity of this function
<i>file</i>	A file handle where this function should print to (may be NULL).

## Returns

The free energy of the input structure given the input sequence in kcal/mol

17.1.2.8 `vrna_eval_structure_pt()`

```
int vrna_eval_structure_pt (
    vrna_fold_compound_t * vc,
    const short * pt )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA.

This function allows for energy evaluation of a given sequence/structure pair where the structure is provided in pair\_table format as obtained from `vrna_ptable()`. Model details, energy parameters, and possibly soft constraints are used as provided via the parameter 'vc'. The fold\_compound does not need to contain any DP matrices, but all the most basic init values as one would get from a call like this:

```
vc = vrna_fold_compound(sequence, NULL, VRNA_OPTION_EVAL_ONLY);
```

## Returns

The free energy of the input structure given the input sequence in 10cal/mol

**SWIG Wrapper Notes** This function is attached as method `eval_structure_pt()` to objects of type `fold_compound`

### 17.1.2.9 vrna\_eval\_structure\_pt\_simple()

```
int vrna_eval_structure_pt_simple (
    const char * string,

    vrna_fold_compound_t * vc,
    int i,
    const short * pt )
```

```
#include <ViennaRNA/eval.h>
```

Calculate energy of a loop.

## Parameters

<i>vc</i>	A <code>vrna_fold_compound_t</code> containing the energy parameters and model details
<i>i</i>	position of covering base pair
<i>pt</i>	the pair table of the secondary structure

## Returns

free energy of the loop in 10cal/mol

    vrna_fold_compound_t * vc,
    const char * structure,
    int m1,
    int m2 )
```

```
#include <ViennaRNA/eval.h>
```

Calculate energy of a move (closing or opening of a base pair)

If the parameters `m1` and `m2` are negative, it is deletion (opening) of a base pair, otherwise it is insertion (opening).

<i>m2</i>	second coordinate of base pair

#### Returns

energy change of the move in 10cal/mol

**SWIG Wrapper Notes** This function is attached as method **eval\_move\_pt()** to objects of type *fold\_compound*

17.1.2.17 `energy_of_structure()`

```
float energy_of_structure (
    const char * string,
    const char * structure,
    int verbosity_level )
```

```
#include <ViennaRNA/eval.h>
```

Calculate the free energy of an already folded RNA using global model detail settings.

If verbosity level is set to a value >0, energies of structure elements are printed to stdout

**Note**

OpenMP: This function relies on several global model settings variables and thus is not to be considered threadsafe. See [energy\\_of\\_struct\\_par\(\)](#) for a completely threadsafe implementation.

#### Compute the Energy contribution of an Exterior loop stem

This definition is a wrapper for the [E\\_Stem\(\)](#) function. It is substituted by an [E\\_Stem\(\)](#) function call with argument `extLoop=1`, so the energy contribution returned reflects a stem introduced in an exterior-loop. As for the parameters `si1` and `sj1` of the substituted [E\\_Stem\(\)](#) function, you can inhibit to take 5'-, 3'-dangles or mismatch contributions to be taken into account by passing -1 to these parameters.

#### Parameters

<i>type</i>	The pair type of the stem-closing pair
<i>si1</i>	The 5'-mismatching nucleotide
<i>sj1</i>	The 3'-mismatching nucleotide
<i>P</i>	The data structure containing scaled energy parameters

#### Returns

The energy contribution of the introduced exterior-loop stem

## 17.2.3.3 E\_Stem()

```
int E_Stem (
    int type,
    int si1,
    int sj1,
    int extLoop,
    vrna_param_t * P )

#include <ViennaRNA/exterior_loops.h>
```

## Compute the energy contribution of a stem branching off a loop-region

This function computes the energy contribution of a stem that branches off a loop region. This can be the case in multiloops, when a stem branching off increases the degree of the loop but also *immediately interior base pairs* of an exterior loop contribute free energy. To switch the behavior of the function according to the evaluation of a multiloop- or exterior-loop-stem, you pass the flag 'extLoop'. The returned energy contribution consists of a TerminalAU penalty if the pair type is greater than 2, dangling end contributions of mismatching nucleotides adjacent to the stem if only one of the si1, sj1 parameters is greater than 0 and mismatch energies if both mismatching nucleotides are positive values. Thus, to avoid incorporating dangling end or mismatch energies just pass a negative number, e.g. -1 to the mismatch argument.

This is an illustration of how the energy contribution is assembled:

```

      3'   5'
      |   |
      X - Y
5'-si1      sj1-3'
```

Here, (X,Y) is the base pair that closes the stem that branches off a loop region. The nucleotides si1 and sj1 are the 5'- and 3'- mismatches, respectively. If the base pair type of (X,Y) is greater than 2 (i.e. an A-U or G-U pair, the TerminalAU penalty will be included in the energy contribution returned. If si1 and sj1 are both nonnegative numbers, mismatch energies will also be included. If one of si1 or sj1 is a negative value, only 5' or 3' dangling end contributions are taken into account. To prohibit any of these mismatch contributions to be incorporated, just pass a negative number to both, si1 and sj1. In case the argument extLoop is 0, the returned energy contribution also includes the *internal-loop-penalty* of a multiloop stem with closing pair type.

## Parameters

<i>type</i>	The pair type of the first base pair on the stem
<i>si1</i>	The 5'-mismatching nucleotide
<i>sj1</i>	The 3'-mismatching nucleotide
<i>extLoop</i>	A flag that indicates whether the contribution reflects the one of an exterior loop or not

    int size,
    int type,
    int sil,
    int sjl,
    const char * string,
    vrna_param_t * P )

#include <ViennaRNA/hairpin_loops.h>
```

Compute the Energy of a hairpin-loop.

To evaluate the free energy of a hairpin-loop, several parameters have to be known. A general hairpin-loop has this structure:

```

      a3 a4
a2      a5
a1      a6
  X  -  Y
  |    |
 5'   3'

```

where X-Y marks the closing pair [e.g. a (**G,C**) pair]. The length of this loop is 6 as there are six unpaired nucleotides (a1-a6) enclosed by (X,Y). The 5' mismatching nucleotide is a1 while the 3' mismatch is a6. The nucleotide sequence of this loop is "a1.a2.a3.a4.a5.a6"

#### Note

The parameter sequence should contain the sequence of the loop in capital letters of the nucleic acid alphabet if the loop size is below 7. This is useful for unusually stable tri-, tetra- and hexa-loops which are treated differently (based on experimental data) if they are tabulated.

<i>size</i>	The size of the loop (number of unpaired nucleotides)
<i>type</i>	The pair type of the base pair closing the hairpin
<i>si1</i>	The 5'-mismatching nucleotide
<i>sj1</i>	The 3'-mismatching nucleotide
<i>string</i>	The sequence of the loop

## Compute the Energy of an interior-loop

This function computes the free energy  $\Delta G$  of an interior-loop with the following structure:

This general structure depicts an interior-loop that is closed by the base pair (X,Y). The enclosed base pair is (V,U) which leaves the unpaired bases a\_1-a\_n and b\_1-b\_n that constitute the loop. In this example, the length of the interior-loop is  $(n + m)$  where n or m may be 0 resulting in a bulge-loop or base pair stack. The mismatching nucleotides for the closing pair (X,Y) are:

5'-mismatch: a\_1

3'-mismatch: b\_m

and for the enclosed base pair (V,U):

5'-mismatch: b\_1

3'-mismatch: a\_n

## Note

Base pairs are always denoted in 5'->3' direction. Thus the enclosed base pair must be 'turned around' when evaluating the free energy of the interior-loop

### 17.4.1 Detailed Description

Functions and data structures to fine-tune the implemented secondary structure evaluation model.

### 17.4.2 Data Structure Documentation

#### 17.4.2.1 struct `vrna_md_s`

The data structure that contains the complete model details used throughout the calculations.

For convenience reasons, we provide the type name [vrna\\_md\\_t](#) to address this data structure without the use of the struct keyword

See also

[vrna\\_md\\_set\\_default\(\)](#), [set\\_model\\_details\(\)](#), [vrna\\_md\\_update\(\)](#), [vrna\\_md\\_t](#)

**SWIG Wrapper Notes** This data structure is wrapped as an object **md** with multiple related functions attached as methods.

A new set of default parameters can be obtained by calling the constructor of **md**:

- `md()` – Initialize with default settings

The resulting object has a list of attached methods which directly correspond to functions that mainly operate on the corresponding C data structure:

- `reset()` – [vrna\\_md\\_set\\_default\(\)](#)
- `set_from_globals()` – [set\\_model\\_details\(\)](#)
- `option_string()` – [vrna\\_md\\_option\\_string\(\)](#)

Note, that default parameters can be modified by directly setting any of the following global variables. Internally, getting/setting default parameters using their global variable representative translates into calls of the following functions, therefore these wrappers for these functions do not exist in the scripting language interface(s):

#### 17.4.2.1.1 Field Documentation

#### 17.4.2.1.1.1 dangles

```
int vrna_md_s::dangles
```

Specifies the dangle model used in any energy evaluation (0,1,2 or 3)

If set to 0 no stabilizing energies are assigned to bases adjacent to helices in free ends and multiloops (so called dangling ends). Normally (dangles = 1) dangling end energies are assigned only to unpaired bases and a base cannot participate simultaneously in two dangling ends. In the partition function algorithm [vrna\\_pf\(\)](#) these checks are neglected. To provide comparability between free energy minimization and partition function algorithms, the default setting is 2. This treatment of dangling ends gives more favorable energies to helices directly adjacent to one another, which can be beneficial since such helices often do engage in stabilizing interactions through co-axial stacking.

If set to 3 co-axial stacking is explicitly included for adjacent helices in multiloops. The option affects only mfe folding and energy evaluation ([vrna\\_mfe\(\)](#) and [vrna\\_eval\\_structure\(\)](#)), as well as suboptimal folding ([vrna\\_subopt\(\)](#)) via re-evaluation of energies. Co-axial stacking with one intervening mismatch is not considered so far.

#### Note

Some function do not implement all dangle model but only a subset of (0,1,2,3). In particular, partition function algorithms can only handle 0 and 2. Read the documentation of the particular recurrences or energy evaluation function for information about the provided dangle model.

#### 17.4.2.1.1.2 min\_loop\_size

```
int vrna_md_s::min_loop_size
```

Minimum size of hairpin loops.

#### Note

The default value for this field is [TURN](#), however, it may be 0 in cofolding context.

## 17.4.4 Function Documentation

## 17.4.4.1 vrna\_md\_set\_default()

```
void vrna_md_set_default (
    vrna_md_t * md )
```

```
#include <ViennaRNA/model.h>
```

Apply default model details to a provided [vrna\\_md\\_t](#) data structure.

Use this function to initialize a [vrna\\_md\\_t](#) data structure with its default values

Parameters

<i>md</i>	A pointer to the data structure that is about to be initialized
-----------	---

## 17.4.4.2 vrna\_md\_update()

```
void vrna_md_update (
    vrna_md_t * md )
```

```
#include <ViennaRNA/model.h>
```

Update the model details data structure.

This function should be called after changing the [vrna\\_md\\_t.energy\\_set](#) attribute since it re-initializes base pairing related arrays within the [vrna\\_md\\_t](#) data structure. In particular, [vrna\\_md\\_t.pair](#), [vrna\\_md\\_t.alias](#), and [vrna\\_md\\_t.rtype](#) are set to the values that correspond to the specified [vrna\\_md\\_t.energy\\_set](#) option

See also

[vrna\\_md\\_t](#), [vrna\\_md\\_t.energy\\_set](#), [vrna\\_md\\_t.pair](#), [vrna\\_md\\_t.rtype](#), [vrna\\_md\\_t.alias](#), [vrna\\_md\\_set\\_default\(\)](#)

#### 17.4.4.3 vrna\_md\_copy()

```
vrna_md_t* vrna_md_copy (
    vrna_md_t * md_to,
    const vrna_md_t * md_from )
```

```
#include <ViennaRNA/model.h>
```

Copy/Clone a `vrna_md_t` model.

Use this function to clone a given model either inplace (target container `md_to` given) or create a copy by cloning the source model and returning it (`md_to == NULL`).

##### Parameters

<code>md_to</code>	The model to be overwritten (if non-NULL and <code>md_to != md_from</code> )
<code>md_from</code>	The model to copy (if non-NULL)

##### Returns

A pointer to the copy model (or NULL if `md_from == NULL`)

#### 17.4.4.4 vrna\_md\_option\_string()

```
char* vrna_md_option_string (
    vrna_md_t * md )
```

```
#include <ViennaRNA/model.h>
```

Get a corresponding commandline parameter string of the options in a `vrna_md_t`.

##### Note

This function is not threadsafe!

#### 17.4.4.5 vrna\_md\_defaults\_reset()

```
void vrna_md_defaults_reset (
    vrna_md_t * md_p )
```

```
#include <ViennaRNA/model.h>
```

Reset the global default model details to a specific set of parameters, or their initial values.

This function resets the global default model details to their initial values, i.e. as specified by the ViennaRNA Package release, upon passing NULL as argument. Alternatively it resets them according to a set of provided parameters.

**Note**

The global default parameters affect all function calls of RNAlib where model details are not explicitly provided. Hence, any change of them is not considered threadsafe

**Warning**

This function first resets the global default settings to factory defaults, and only then applies user provided settings (if any). User settings that do not meet specifications are skipped.

**See also**

[vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#)

**Parameters**

<i>md</i> <sub>↔</sub> <i>_p</i>	A set of model details to use as global default (if NULL is passed, factory defaults are restored)
-------------------------------------	--

**17.4.4.6 vrna\_md\_defaults\_temperature()**

```
void vrna_md_defaults_temperature (
    double T )
```

```
#include <ViennaRNA/model.h>
```

Set default temperature for energy evaluation of loops.

**See also**

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_TEMPERATURE](#)

**Parameters**

<i>T</i>	Temperature in centigrade
----------	---------------------------

**17.4.4.7 vrna\_md\_defaults\_temperature\_get()**

```
double vrna_md_defaults_temperature_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default temperature for energy evaluation of loops.

**See also**

**Returns**

The global default settings for temperature in centigrade

**17.4.4.8 vrna\_md\_defaults\_betaScale()**

```
void vrna_md_defaults_betaScale (
    double b )
```

```
#include <ViennaRNA/model.h>
```

Set default scaling factor of thermodynamic temperature in Boltzmann factors.

Boltzmann factors are then computed as  $\exp(-E/(b \cdot kT))$ .

**See also**

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_BETA\\_SCALE](#)

**Parameters**

<i>b</i>	The scaling factor, default is 1.0
----------	------------------------------------

**17.4.4.9 vrna\_md\_defaults\_betaScale\_get()**

```
double vrna_md_defaults_betaScale_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default scaling factor of thermodynamic temperature in Boltzmann factors.

**See also**

**Returns**

The global default thermodynamic temperature scaling factor

#### 17.4.4.10 `vrna_md_defaults_dangles()`

```
void vrna_md_defaults_dangles (
    int d )
```

```
#include <ViennaRNA/model.h>
```

Set default dangle model for structure prediction.

Parameters

<i>d</i>	The dangle model
----------	------------------

#### 17.4.4.11 `vrna_md_defaults_dangles_get()`

```
int vrna_md_defaults_dangles_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default dangle model for structure prediction.

See also

Returns

The global default settings for the dangle model

#### 17.4.4.12 `vrna_md_defaults_special_hp()`

```
void vrna_md_defaults_special_hp (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for lookup of tabulated free energies for special hairpin loops, such as Tri-, Tetra-, or Hexa-loops.

See also

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_SPECIAL\\_HP](#)

## Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.13 `vrna_md_defaults_special_hp_get()`

```
int vrna_md_defaults_special_hp_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for lookup of tabulated free energies for special hairpin loops, such as Tri-, Tetra-, or Hexa-loops.

## See also

[vrna\\_md\\_defaults\\_special\\_hp\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_SP](#)

## Returns

The global default settings for the treatment of special hairpin loops

17.4.4.14 `vrna_md_defaults_noLP()`

```
void vrna_md_defaults_noLP (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for prediction of canonical secondary structures.

## See also

## Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.15 `vrna_md_defaults_noLP_get()`

```
int vrna_md_defaults_noLP_get (
```

```
void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for prediction of canonical secondary structures.

See also

[vrna\\_md\\_defaults\\_noLP\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_NO\\_LP](#)

Returns

The global default settings for predicting canonical secondary structures

#### 17.4.4.16 vrna\_md\_defaults\_noGU()

```
void vrna_md_defaults_noGU (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for treatment of G-U wobble pairs.

See also

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_NO\\_GU](#)

Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

#### 17.4.4.17 vrna\_md\_defaults\_noGU\_get()

```
int vrna_md_defaults_noGU_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for treatment of G-U wobble pairs.

See also

[vrna\\_md\\_defaults\\_noGU\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_NO\\_GU](#)

Returns

The global default settings for treatment of G-U wobble pairs

**17.4.4.18 vrna\_md\_defaults\_noGUclosure()**

```
void vrna_md_defaults_noGUclosure (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for G-U pairs as closing pair for loops.

**See also**

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_NO\\_GU\\_CLOSURE](#)

**Parameters**

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

**17.4.4.19 vrna\_md\_defaults\_noGUclosure\_get()**

```
int vrna_md_defaults_noGUclosure_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for G-U pairs as closing pair for loops.

**See also**

[vrna\\_md\\_defaults\\_noGUclosure\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_NO\\_GU\\_CLOSURE](#)

**Returns**

The global default settings for treatment of G-U pairs closing a loop

**17.4.4.20 vrna\_md\_defaults\_logML()**

```
void vrna_md_defaults_logML (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior recomputing free energies of multi-branch loops using a logarithmic model.

**See also**

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_LOG\\_ML](#)

## Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.21 `vrna_md_defaults_logML_get()`

```
int vrna_md_defaults_logML_get (  
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior recomputing free energies of multi-branch loops using a logarithmic model.

## See also

## Returns

The global default settings for logarithmic model in multi-branch loop free energy evaluation

17.4.4.22 `vrna_md_defaults_circ()`

```
void vrna_md_defaults_circ (  
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior whether input sequences are circularized.

## See also

## Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.23 `vrna_md_defaults_circ_get()`

```
int vrna_md_defaults_circ_get (  
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior whether input sequences are circularized.

See also

[vrna\\_md\\_defaults\\_circ\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_CIRC](#)

Returns

The global default settings for treating input sequences as circular

#### 17.4.4.24 vrna\_md\_defaults\_gquad()

```
void vrna_md_defaults_gquad (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for treatment of G-Quadruplexes.

Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

#### 17.4.4.25 vrna\_md\_defaults\_gquad\_get()

```
int vrna_md_defaults_gquad_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for treatment of G-Quadruplexes.

See also

[vrna\\_md\\_defaults\\_gquad\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_GQUAD](#)

Returns

The global default settings for treatment of G-Quadruplexes

17.4.4.26 `vrna_md_defaults_uniq_ML()`

```
void vrna_md_defaults_uniq_ML (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for creating additional matrix for unique multi-branch loop prediction.

**Note**

Activating this option usually results in higher memory consumption!

**See also**

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_UNIQ\\_ML](#)

**Parameters**

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.27 `vrna_md_defaults_uniq_ML_get()`

```
int vrna_md_defaults_uniq_ML_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for creating additional matrix for unique multi-branch loop prediction.

**See also**

[vrna\\_md\\_defaults\\_uniq\\_ML\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_UNIQ\\_ML](#)

**Returns**

The global default settings for creating additional matrices for unique multi-branch loop prediction

17.4.4.28 `vrna_md_defaults_energy_set()`

```
void vrna_md_defaults_energy_set (
    int e )
```

```
#include <ViennaRNA/model.h>
```

Set default energy set.

## Parameters

<i>e</i>	Energy set (0, 1, 2, 3)
----------	-------------------------

17.4.4.29 `vrna_md_defaults_energy_set_get()`

```
int vrna_md_defaults_energy_set_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default energy set.

## See also

## Returns

The global default settings for the energy set

17.4.4.30 `vrna_md_defaults_backtrack()`

```
void vrna_md_defaults_backtrack (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for whether to backtrack secondary structures.

## See also

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_BACKTRACK](#)

## Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.31 `vrna_md_defaults_backtrack_get()`

```
int vrna_md_defaults_backtrack_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default behavior for whether to backtrack secondary structures.

See also

Returns

The global default settings for backtracking structures

#### 17.4.4.32 vrna\_md\_defaults\_backtrack\_type()

```
void vrna_md_defaults_backtrack_type (
    char t )
```

```
#include <ViennaRNA/model.h>
```

Set default backtrack type, i.e. which DP matrix is used.

See also

[vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_BACKTRACK\\_TYPE](#)

Parameters

<i>t</i>	The type ('F', 'C', or 'M')
----------	-----------------------------

#### 17.4.4.33 vrna\_md\_defaults\_backtrack\_type\_get()

```
char vrna_md_defaults_backtrack_type_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default backtrack type, i.e. which DP matrix is used.

See also

[vrna\\_md\\_defaults\\_backtrack\\_type\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_BACKTRACK\\_TYPE](#)

Returns

The global default settings that specify which DP matrix is used for backtracking

17.4.4.34 `vrna_md_defaults_compute_bpp()`

```
void vrna_md_defaults_compute_bpp (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set the default behavior for whether to compute base pair probabilities after partition function computation.

Parameters

<i>flag</i>	On/Off switch (0 = OFF, else = ON)
-------------	------------------------------------

17.4.4.35 `vrna_md_defaults_compute_bpp_get()`

```
int vrna_md_defaults_compute_bpp_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get the default behavior for whether to compute base pair probabilities after partition function computation.

See also

[vrna\\_md\\_defaults\\_compute\\_bpp\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_md\\_t](#), [VRNA\\_MODEL\\_DEFAULT\\_COMPUTE\\_BPP](#)

Returns

The global default settings that specify whether base pair probabilities are computed together with partition function

17.4.4.36 `vrna_md_defaults_max_bp_span()`

```
void vrna_md_defaults_max_bp_span (
    int span )
```

```
#include <ViennaRNA/model.h>
```

Set default maximal base pair span.

## Parameters

<i>span</i>	Maximal base pair span
-------------	------------------------

**17.4.4.37 vrna\_md\_defaults\_max\_bp\_span\_get()**

```
int vrna_md_defaults_max_bp_span_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default maximal base pair span.

## See also

## Returns

The global default settings for maximum base pair span

**17.4.4.38 vrna\_md\_defaults\_min\_loop\_size()**

```
void vrna_md_defaults_min_loop_size (
    int size )
```

```
#include <ViennaRNA/model.h>
```

Set default minimal loop size.

## See also

## Parameters

<i>size</i>	Minimal size, i.e. number of unpaired nucleotides for a hairpin loop
-------------	--

**17.4.4.39 vrna\_md\_defaults\_min\_loop\_size\_get()**

```
int vrna_md_defaults_min_loop_size_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default minimal loop size.

Returns

The global default settings for minimal size of hairpin loops

#### 17.4.4.40 vrna\_md\_defaults\_window\_size()

```
void vrna_md_defaults_window_size (
    int size )
```

```
#include <ViennaRNA/model.h>
```

Set default window size for sliding window structure prediction approaches.

Parameters

<i>size</i>	The size of the sliding window
-------------	--------------------------------

#### 17.4.4.41 vrna\_md\_defaults\_window\_size\_get()

```
int vrna_md_defaults_window_size_get (
    void )
```

```
#include <ViennaRNA/model.h>
```

Get default window size for sliding window structure prediction approaches.

Returns

The global default settings for the size of the sliding window

#### 17.4.4.42 vrna\_md\_defaults\_oldAliEn()

```
void vrna_md_defaults_oldAliEn (
    int flag )
```

```
#include <ViennaRNA/model.h>
```

Set default behavior for whether to use old energy model for comparative structure prediction.

##### Note

This option is outdated. Activating the old energy model usually results in worse consensus structure predictions.

### 17.4.5 Variable Documentation

#### 17.4.5.1 temperature

```
double temperature
```

```
#include <ViennaRNA/model.h>
```

Rescale energy parameters to a temperature in degC.

Default is 37C. You have to call the `update___params()` functions after changing this parameter.

**Deprecated** Use `vrna_md_defaults_temperature()`, and `vrna_md_defaults_temperature_get()` to change, and read the global default temperature settings

See also

[vrna\\_md\\_defaults\\_temperature\(\)](#), [vrna\\_md\\_defaults\\_temperature\\_get\(\)](#), [vrna\\_md\\_defaults\\_reset\(\)](#)

#### 17.4.5.2 pf\_scale

```
double pf_scale
```

```
#include <ViennaRNA/model.h>
```

A scaling factor used by [pf\\_fold\(\)](#) to avoid overflows.

Should be set to approximately  $\exp((-F/kT)/length)$ , where  $F$  is an estimate for the ensemble free energy, for example the minimum free energy. You must call [update\\_pf\\_params\(\)](#) after changing this parameter.

If `pf_scale` is -1 (the default) , an estimate will be provided automatically when computing partition functions, e.g. [pf\\_fold\(\)](#) The automatic estimate is usually insufficient for sequences more than a few hundred bases long.

### 17.4.5.3 dangles

```
int dangles
```

```
#include <ViennaRNA/model.h>
```

Switch the energy model for dangling end contributions (0, 1, 2, 3)

If set to 0 no stabilizing energies are assigned to bases adjacent to helices in free ends and multiloops (so called dangling ends). Normally (dangles = 1) dangling end energies are assigned only to unpaired bases and a base cannot participate simultaneously in two dangling ends. In the partition function algorithm `pf_fold()` these checks are neglected. If `dangles` is set to 2, all folding routines will follow this convention. This treatment of dangling ends gives more favorable energies to helices directly adjacent to one another, which can be beneficial since such helices often do engage in stabilizing interactions through co-axial stacking.

If dangles = 3 co-axial stacking is explicitly included for adjacent helices in multiloops. The option affects only mfe folding and energy evaluation (`fold()` and `energy_of_structure()`), as well as suboptimal folding (`subopt()`) via re-evaluation of energies. Co-axial stacking with one intervening mismatch is not considered so far.

Default is 2 in most algorithms, partition function algorithms can only handle 0 and 2

### 17.4.5.4 tetra\_loop

```
int tetra_loop
```

```
#include <ViennaRNA/model.h>
```

Include special stabilizing energies for some tri-, tetra- and hexa-loops;.

default is 1.

### 17.4.5.5 noLonelyPairs

```
int noLonelyPairs
```

```
#include <ViennaRNA/model.h>
```

Global switch to avoid/allow helices of length 1.

Disallow all pairs which can only occur as lonely pairs (i.e. as helix of length 1). This avoids lonely base pairs in the predicted structures in most cases.

### 17.4.5.6 energy\_set

```
int energy_set
```

```
#include <ViennaRNA/model.h>
```

0 = BP; 1=any with GC; 2=any with AU-parameter

If set to 1 or 2: fold sequences from an artificial alphabet ABCD..., where A pairs B, C pairs D, etc. using either GC (1) or AU parameters (2); default is 0, you probably don't want to change it.

#### 17.4.5.7 do\_backtrack

```
int do_backtrack
```

```
#include <ViennaRNA/model.h>
```

do backtracking, i.e. compute secondary structures or base pair probabilities

If 0, do not calculate pair probabilities in [pf\\_fold\(\)](#); this is about twice as fast. Default is 1.

#### 17.4.5.8 backtrack\_type

```
char backtrack_type
```

```
#include <ViennaRNA/model.h>
```

A backtrack array marker for [inverse\\_fold\(\)](#)

If set to 'C': force (1,N) to be paired, 'M' fold as if the sequence were inside a multiloop. Otherwise ('F') the usual mfe structure is computed.

#### 17.4.5.9 nonstandards

```
char* nonstandards
```

```
#include <ViennaRNA/model.h>
```

contains allowed non standard base pairs

Lists additional base pairs that will be allowed to form in addition to GC, CG, AU, UA, GU and UG. Nonstandard base pairs are given a stacking energy of 0.

#### 17.4.5.10 max\_bp\_span

```
int max_bp_span
```

```
#include <ViennaRNA/model.h>
```

Maximum allowed base pair span.

A value of -1 indicates no restriction for distant base pairs.

### 17.5.1 Detailed Description

All relevant functions to retrieve and copy pre-calculated energy parameter sets as well as reading/writing the energy parameter set from/to file(s).

This module covers all relevant functions for pre-calculation of the energy parameters necessary for the folding routines provided by RNAlib. Furthermore, the energy parameter set in the RNAlib can be easily exchanged by a user-defined one. It is also possible to write the current energy parameter set into a text file.

#### 17.5.2.2.1 Field Documentation

#### 17.5.2.2.1.1 id

```
int vrna_exp_param_s::id
```

An identifier for the data structure.

**Deprecated** This attribute will be removed in version 3

#### 17.5.2.2.1.2 alpha

```
double vrna_exp_param_s::alpha
```

Scaling factor for the thermodynamic temperature.

This allows for temperature scaling in Boltzmann factors independently from the energy contributions. The resulting Boltzmann factors are then computed by  $e^{-E/(\alpha \cdot K \cdot T)}$

## 17.5.4 Function Documentation

### 17.5.4.1 vrna\_params()

```
vrna_param_t* vrna_params (
    vrna_md_t * md )
```

```
#include <ViennaRNA/params.h>
```

Get a data structure containing prescaled free energy parameters.

If a NULL pointer is passed for the model details parameter, the default model parameters are stored within the requested `vrna_param_t` structure.

See also

`vrna_md_t`, `vrna_md_set_default()`, `vrna_exp_params()`

## Parameters

<i>md</i>	A pointer to the model details to store inside the structure (Maybe NULL)
-----------	---

## Returns

A pointer to the memory location where the requested parameters are stored

17.5.4.2 `vrna_params_copy()`

```
vrna_param_t* vrna_params_copy (
    vrna_param_t * par )
```

```
#include <ViennaRNA/params.h>
```

Get a copy of the provided free energy parameters.

If NULL is passed as parameter, a default set of energy parameters is created and returned.

## See also

[vrna\\_params\(\)](#), [vrna\\_param\\_t](#)

## Parameters

<i>par</i>	The free energy parameters that are to be copied (Maybe NULL)
------------	---

## Returns

A copy or a default set of the (provided) parameters

17.5.4.3 `vrna_exp_params()`

```
vrna_exp_param_t* vrna_exp_params (
    vrna_md_t * md )
```

```
#include <ViennaRNA/params.h>
```

Get a data structure containing prescaled free energy parameters already transformed to Boltzmann factors.

This function returns a data structure that contains all necessary precomputed energy contributions for each type of loop.

In contrast to [vrna\\_params\(\)](#), the free energies within this data structure are stored as their Boltzmann factors, i.e.

$$\exp(-E/kT)$$

where  $E$  is the free energy.

If a NULL pointer is passed for the model details parameter, the default model parameters are stored within the requested [vrna\\_exp\\_param\\_t](#) structure.

See also

[vrna\\_md\\_t](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_params\(\)](#), [vrna\\_rescale\\_pf\\_params\(\)](#)

Parameters

<i>md</i>	A pointer to the model details to store inside the structure (Maybe NULL)
-----------	---

Returns

A pointer to the memory location where the requested parameters are stored

#### 17.5.4.4 `vrna_exp_params_comparative()`

```
vrna_exp_param_t* vrna_exp_params_comparative (
    unsigned int n_seq,
    vrna_md_t * md )
```

```
#include <ViennaRNA/params.h>
```

Get a data structure containing prescaled free energy parameters already transformed to Boltzmann factors (alifold version)

If a NULL pointer is passed for the model details parameter, the default model parameters are stored within the requested [vrna\\_exp\\_param\\_t](#) structure.

See also

[vrna\\_md\\_t](#), [vrna\\_md\\_set\\_default\(\)](#), [vrna\\_exp\\_params\(\)](#), [vrna\\_params\(\)](#)

Parameters

<i>n_seq</i>	The number of sequences in the alignment
<i>md</i>	A pointer to the model details to store inside the structure (Maybe NULL)

Returns

A pointer to the memory location where the requested parameters are stored

#### 17.5.4.5 `vrna_exp_params_copy()`

```
vrna_exp_param_t* vrna_exp_params_copy (
    vrna_exp_param_t * par )
```

```
#include <ViennaRNA/params.h>
```

Get a copy of the provided free energy parameters (provided as Boltzmann factors)

If NULL is passed as parameter, a default set of energy parameters is created and returned.

See also

[vrna\\_exp\\_params\(\)](#), [vrna\\_exp\\_param\\_t](#)

Parameters

<i>par</i>	The free energy parameters that are to be copied (Maybe NULL)
------------	---

Returns

A copy or a default set of the (provided) parameters

#### 17.5.4.6 vrna\_params\_subst()

```
void vrna_params_subst (
    vrna_fold_compound_t * vc,
    vrna_param_t * par )
```

```
#include <ViennaRNA/params.h>
```

Update/Reset energy parameters data structure within a [vrna\\_fold\\_compound\\_t](#).

Passing NULL as second argument leads to a reset of the energy parameters within vc to their default values. Otherwise, the energy parameters provided will be copied over into vc.

See also

[vrna\\_params\\_reset\(\)](#), [vrna\\_param\\_t](#), [vrna\\_md\\_t](#), [vrna\\_params\(\)](#)

Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> that is about to receive updated energy parameters
<i>par</i>	The energy parameters used to substitute those within vc (Maybe NULL)

**SWIG Wrapper Notes** This function is attached to [vrna\\_fc\\_s](#) objects as **params\_subst()** method.

#### 17.5.4.7 vrna\_exp\_params\_subst()

```
void vrna_exp_params_subst (
    vrna_fold_compound_t * vc,
    vrna_exp_param_t * params )
```

```
#include <ViennaRNA/params.h>
```

Update the energy parameters for subsequent partition function computations.

This function can be used to properly assign new energy parameters for partition function computations to a [vrna\\_fold\\_compound\\_t](#). For this purpose, the data of the provided pointer `params` will be copied into `vc` and a recomputation of the partition function scaling factor is issued, if the `pf_scale` attribute of `params` is less than 1.0.

Passing NULL as second argument leads to a reset of the energy parameters within `vc` to their default values

See also

#### Parameters

<code>vc</code>	The fold compound data structure
<code>params</code>	A pointer to the new energy parameters

#### 17.5.4.8 vrna\_exp\_params\_rescale()

```
void vrna_exp_params_rescale (
    vrna_fold_compound_t * vc,
    double * mfe )
```

```
#include <ViennaRNA/params.h>
```

Rescale Boltzmann factors for partition function computations.

This function may be used to (automatically) rescale the Boltzmann factors used in partition function computations. Since partition functions over subsequences can easily become extremely large, the RNAlib internally rescales them to avoid numerical over- and/or underflow. Therefore, a proper scaling factor  $s$  needs to be chosen that in turn is then used to normalize the corresponding partition functions  $\hat{q}[i, j] = q[i, j]/s^{(j-i+1)}$ .

This function provides two ways to automatically adjust the scaling factor.

1. Automatic guess
2. Automatic adjustment according to MFE

Passing NULL as second parameter activates the *automatic guess mode*. Here, the scaling factor is recomputed according to a mean free energy of  $184.3 \cdot \text{length}$  cal for random sequences.

#### Note

This recomputation only takes place if the `pf_scale` attribute of the `exp_params` data structure contained in `vc` has a value below 1.0.

On the other hand, if the MFE for a sequence is known, it can be used to recompute a more robust scaling factor, since it represents the lowest free energy of the entire ensemble of structures, i.e. the highest Boltzmann factor. To activate this second mode of *automatic adjustment according to MFE*, a pointer to the MFE value needs to be passed as second argument. This value is then taken to compute the scaling factor as  $s = \exp((s_{fact} * MFE)/kT/length)$ , where `sfact` is an additional scaling weight located in the `vrna_md_t` data structure of `exp_params` in `vc`.

The computed scaling factor  $s$  will be stored as `pf_scale` attribute of the `exp_params` data structure in `vc`.

### 17.6.1 Detailed Description

This module covers simple and straight-forward extensions to the RNA folding grammar.

Some applications of RNA secondary structure prediction require an extension of the *regular* RNA folding grammar. For instance one would like to include proteins and other ligands binding to unpaired loop regions while competing with conventional base pairing. Another application could be that one may want to include the formation of self-enclosed structural modules, such as G-quadruplexes. For such applications, we provide a pair of additional domains that extend the regular RNA folding grammar, [Structured domains](#) and [Unstructured domains](#).

While unstructured domains are usually determined by a more or less precise sequence motif, e.g. the binding site for a protein, structured domains are considered self-enclosed modules with a more or less complex pairing pattern. Our extension with these two domains introduces two production rules to fill additional dynamic programming matrices  $S$  and  $U$  where we store the pre-computed contributions of structured domains ( $S$ ), and unstructured domains ( $U$ ).

For the sake of flexibility, each of the domains is associated with a specific data structure serving as an abstract interface to the extension. The interface uses callback functions to (i) pre-compute arbitrary data, e.g. filling up additional dynamic programming matrices, and (ii) evaluate the contribution of a paired or unpaired structural feature of the RNA. Implementations of these callbacks are separate for regular free energy evaluation, e.g. MFE prediction, and partition function applications. A data structure holding arbitrary data required for the callback functions can be associated to the domain as well. While RNAlib comes with a default implementation for structured and unstructured domains, the system is entirely user-customizable.

### 17.7.1 Detailed Description

Add and modify unstructured domains to the RNA folding grammar.

This module provides the tools to add and modify unstructured domains to the production rules of the RNA folding grammar. Usually this functionality is utilized for incorporating ligand binding to unpaired stretches of an RNA.

Unstructured domains appear in the production rules of the RNA folding grammar wherever new unpaired nucleotides are attached to a growing substructure (see also [12]):

The white boxes represent the stretch of RNA bound to the ligand and represented by a more or less specific sequence motif. The motif itself is considered unable to form basepairs. The additional production rule U is used to precompute the contribution of unpaired stretches possibly bound by one or more ligands. The auxiliary DP matrix for this production rule is filled right before processing the other (regular) production rules of the RNA folding grammar.

In a context with [Structured domains](#) the grammar is extended as follows:

**Bug** Although the additional production rule(s) for unstructured domains in the descriptions of this feature are always treated as 'segments possibly bound to one or more ligands', the current implementation requires that at least one ligand is bound. The default implementation already takes care of the required changes, however, upon using callback functions other than the default ones, one has to take care of this fact. Please also note, that this behavior might change in one of the next releases, such that the decomposition schemes as shown above comply with the actual implementation.

A default implementation allows one to readily use this feature by simply adding sequence motifs and corresponding binding free energies with the function `vrna_ud_add_motif()` (see also [Ligands binding to unstructured domains](#)).

The grammar extension is realized using a callback function that

- evaluates the binding free energy of a ligand to its target sequence segment (white boxes in the figures above), or
- returns the free energy of an unpaired stretch possibly bound by a ligand, stored in the additional *UDP* matrix.

The callback is passed the segment positions, the loop context, and which of the two above mentioned evaluations are required. A second callback implements the pre-processing step that prepares the *UDP* matrix by evaluating all possible cases of the additional production rule. Both callbacks have a default implementation in *RNAlib*, but may be over-written by a user-implementation, making it fully user-customizable.

For equilibrium probability computations, two additional callbacks exist. One to store/add and one to retrieve the probability of unstructured domains at particular positions. Our implementation already takes care of computing the probabilities, but users of the unstructured domain feature are required to provide a mechanism to efficiently store/add the corresponding values into some external data structure.

## 17.7.2.1.1 Field Documentation

17.7.2.1.1.1 `prod_cb`

```
vrna_callback_ud_production* vrna_unstructured_domain_s::prod_cb
```

Callback to ligand binding production rule, i.e. create/fill DP free energy matrices.

This callback will be executed right before the actual secondary structure decompositions, and, therefore, any implementation must not interleave with the regular DP matrices.

## 17.7.3 Typedef Documentation

### 17.7.3.1 vrna\_callback\_ud\_energy

int loop_type, void *data)
```

```
#include <ViennaRNA/unstructured_domains.h>
```

Callback to retrieve Boltzmann factor of the binding free energy of a ligand bound to an unpaired sequence segment.

**Notes on Callback Functions** This function will be called to determine the additional energy contribution of a specific unstructured domain, e.g. the binding free energy of some ligand (Partition function variant, i.e. the Boltzmann factors instead of actual free energies).

#### Parameters

<i>vc</i>	The current <a href="#">vrna_fold_compound_t</a>
<i>i</i>	The start of the unstructured domain (5' end)
<i>j</i>	The end of the unstructured domain (3' end)
<i>loop_type</i>	The loop context of the unstructured domain
<i>data</i>	Auxiliary data

**Returns**

The auxiliary energy contribution as Boltzmann factor

**17.7.3.3 vrna\_callback\_ud\_production**

```
typedef void() vrna_callback_ud_production(vrna_fold_compound_t *vc, void *data)

```

Callback to store/add equilibrium probability for a ligand bound to an unpaired sequence segment.

**Notes on Callback Functions** A callback function to store equilibrium probabilities for the unstructured domain feature

### 17.7.3.6 vrna\_callback\_ud\_probs\_get

```
typedef FLT_OR_DBL() vrna_callback_ud_probs_get(vrna_fold_compound_t *vc, int i, int j, unsigned
int loop_type, int motif, void *data)
```

```
#include <ViennaRNA/unstructured_domains.h>
```

Callback to retrieve equilibrium probability for a ligand bound to an unpaired sequence segment.

**Notes on Callback Functions** A callback function to retrieve equilibrium probabilities for the unstructured domain feature

## 17.7.4 Function Documentation

### 17.7.4.1 vrna\_ud\_add\_motif()

```
void vrna_ud_add_motif (
    vrna_fold_compound_t * vc,
    const char * motif,
    double motif_en,
    unsigned int loop_type )
```

```
#include <ViennaRNA/unstructured_domains.h>
```

Add an unstructured domain motif, e.g. for ligand binding.

This function adds a ligand binding motif and the associated binding free energy to the [vrna\\_ud\\_t](#) attribute of a [vrna\\_fold\\_compound\\_t](#). The motif data will then be used in subsequent secondary structure predictions. Multiple calls to this function with different motifs append all additional data to a list of ligands, which all will be evaluated. Ligand motif data can be removed from the [vrna\\_fold\\_compound\\_t](#) again using the [vrna\\_ud\\_remove\(\)](#) function. The loop type parameter allows one to limit the ligand binding to particular loop type, such as the exterior loop, hairpin loops, interior loops, or multibranch loops.

```
void vrna_ud_remove (
    vrna_fold_compound_t * vc )

#include <ViennaRNA/unstructured_domains.h>
```

Remove ligand binding to unpaired stretches.

This function removes all ligand motifs that were bound to a `vrna_fold_compound_t` using the `vrna_ud_add_motif()` function.

#### Parameters

<code>vc</code>	The <code>vrna_fold_compound_t</code> data structure the ligand motif data should be removed from

    vrna_fold_compound_t * vc,
    void * data,
    vrna_callback_free_auxdata * free )

#include <ViennaRNA/unstructured_domains.h>
```

Attach an auxiliary data structure.

This function binds an arbitrary, auxiliary data structure for user-implemented ligand binding. The optional callback `free` will be passed the bound data structure whenever the `vrna_fold_compound_t` is removed from memory to avoid memory leaks.

### 17.9.1 Detailed Description

This module provides general functions that allow for an easy control of constrained secondary structure prediction and evaluation.

Secondary Structure constraints can be subdivided into two groups:

- [Hard constraints](#), and
- [Soft constraints](#).

While Hard-Constraints directly influence the production rules used in the folding recursions by allowing, disallowing, or enforcing certain decomposition steps, Soft-constraints on the other hand are used to change position specific contributions in the recursions by adding bonuses/penalties in form of pseudo free energies to certain loop configurations.

Secondary structure constraints are always applied at decomposition level, i.e. in each step of the recursive structure decomposition, for instance during MFE prediction. Below is a visualization of the decomposition scheme

For [Hard constraints](#) the following option flags may be used to constrain the pairing behavior of single, or pairs of nucleotides:

- [VRNA\\_CONSTRAINT\\_CONTEXT\\_EXT\\_LOOP](#) - Hard constraints flag, base pair in the exterior loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_HP\\_LOOP](#) - Hard constraints flag, base pair encloses hairpin loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_INT\\_LOOP](#) - Hard constraints flag, base pair encloses an interior loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_INT\\_LOOP\\_ENC](#) - Hard constraints flag, base pair encloses a multi branch loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_MB\\_LOOP](#) - Hard constraints flag, base pair is enclosed in an interior loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_MB\\_LOOP\\_ENC](#) - Hard constraints flag, base pair is enclosed in a multi branch loop.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_ENFORCE](#) - Hard constraint flag to indicate enforcement of constraints.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_NO\\_REMOVE](#) - Hard constraint flag to indicate not to remove base pairs that conflict with a given constraint.
- [VRNA\\_CONSTRAINT\\_CONTEXT\\_ALL\\_LOOPS](#) - Constraint context flag indicating any loop context.

However, for [Soft constraints](#) we do not allow for simple loop type dependent constraining. But soft constraints are equipped with generic constraint support. This enables the user to pass arbitrary callback functions that return auxiliary energy contributions for evaluation the evaluation of any decomposition.

The callback will then always be notified about the type of decomposition that is happening, and the corresponding delimiting sequence positions. The following decomposition steps are distinguished, and should be captured by the user's implementation of the callback:

- [VRNA\\_DECOMP\\_PAIR\\_HP](#) - Flag passed to generic softt constraints callback to indicate hairpin loop decomposition step.
- [VRNA\\_DECOMP\\_PAIR\\_IL](#) - Indicator for interior loop decomposition step.
- [VRNA\\_DECOMP\\_PAIR\\_ML](#) - Indicator for multibranch loop decomposition step.
- [VRNA\\_DECOMP\\_ML\\_ML\\_ML](#) - Indicator for decomposition of multibranch loop part.

- [VRNA\\_DECOMP\\_ML\\_STEM](#) - Indicator for decomposition of multibranch loop part.
- [VRNA\\_DECOMP\\_ML\\_ML](#) - Indicator for decomposition of multibranch loop part.
- [VRNA\\_DECOMP\\_ML\\_UP](#) - Indicator for decomposition of multibranch loop part.
- [VRNA\\_DECOMP\\_ML\\_ML\\_STEM](#) - Indicator for decomposition of multibranch loop part.
- [VRNA\\_DECOMP\\_ML\\_COAXIAL](#) - Indicator for decomposition of multibranch loop part.
- [VRNA\\_DECOMP\\_EXT\\_EXT](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_UP](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_STEM](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_EXT\\_EXT](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_STEM\\_EXT](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_STEM\\_OUTSIDE](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_EXT\\_STEM](#) - Indicator for decomposition of exterior loop part.
- [VRNA\\_DECOMP\\_EXT\\_EXT\\_STEM1](#) - Indicator for decomposition of exterior loop part.

Simplified interfaces to the soft constraints framework can be obtained by the implementations in the submodules

- [SHAPE reactivity data](#) and
- [ligands](#).

An implementation that generates soft constraints for unpaired nucleotides by minimizing the discrepancy between their predicted and expected pairing probability is available in submodule [Generate soft constraints from data](#).

## 17.9.2 Macro Definition Documentation

### 17.9.2.1 VRNA\_CONSTRAINT\_FILE

```
#define VRNA_CONSTRAINT_FILE 0

#include <ViennaRNA/constraints.h>
```

Flag for [vrna\\_constraints\\_add\(\)](#) to indicate that constraints are present in a text file.

See also

[vrna\\_constraints\\_add\(\)](#)

**Deprecated** Use 0 instead!

## 17.9.2.2 VRNA\_CONSTRAINT\_SOFT\_MFE

```
#define VRNA_CONSTRAINT_SOFT_MFE 0
#include <ViennaRNA/constraints.h>
```

Indicate generation of constraints for MFE folding.

**Deprecated** This flag has no meaning anymore, since constraints are now always stored!

## 17.9.2.3 VRNA\_CONSTRAINT\_SOFT\_PF

```
#define VRNA_CONSTRAINT_SOFT_PF VRNA_OPTION_PF
#include <ViennaRNA/constraints.h>
```

Indicate generation of constraints for partition function computation.

**Deprecated** Use `VRNA_OPTION_PF` instead!

## 17.9.2.4 VRNA\_DECOMP\_PAIR\_HP

```
#define VRNA_DECOMP_PAIR_HP (unsigned char)1
#include <ViennaRNA/constraints.h>
```

Flag passed to generic softt constraints callback to indicate hairpin loop decomposition step.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a hairpin loop enclosed by the base pair  $(i, j)$ .

## 17.9.2.5 VRNA\_DECOMP\_PAIR\_IL

```
#define VRNA_DECOMP_PAIR_IL (unsigned char)2
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for interior loop decomposition step.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an interior loop enclosed by the base pair  $(i, j)$ , and enclosing the base pair  $(k, l)$ .

## 17.9.2.6 VRNA\_DECOMP\_PAIR\_ML

```
#define VRNA_DECOMP_PAIR_ML (unsigned char)3
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for multibranch loop decomposition step.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multi-branch loop enclosed by the base pair  $(i, j)$ , and consisting of some enclosed multi loop content from  $k$  to  $l$ .

## 17.9.2.7 VRNA\_DECOMP\_ML\_ML\_ML

```
#define VRNA_DECOMP_ML_ML_ML (unsigned char)5
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multi-branch loop part in the interval  $[i : j]$ , which will be decomposed into two multibranch loop parts  $[i : k]$ , and  $[l : j]$ .

## 17.9.2.8 VRNA\_DECOMP\_ML\_STEM

```
#define VRNA_DECOMP_ML_STEM (unsigned char)6
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multibranch loop part in the interval  $[i : j]$ , which will be considered a single stem branching off with base pair  $(k, l)$ .

## 17.9.2.9 VRNA\_DECOMP\_ML\_ML

```
#define VRNA_DECOMP_ML_ML (unsigned char)7
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multibranch loop part in the interval  $[i : j]$ , which will be decomposed into a (usually) smaller multibranch loop part  $[k : l]$ .

## 17.9.2.10 VRNA\_DECOMP\_ML\_UP

```
#define VRNA_DECOMP_ML_UP (unsigned char)8
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multibranch loop part in the interval  $[i : j]$ , which will be considered a multibranch loop part that only consists of unpaired nucleotides.

## 17.9.2.11 VRNA\_DECOMP\_ML\_ML\_STEM

```
#define VRNA_DECOMP_ML_ML_STEM (unsigned char)9
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multibranch loop part in the interval  $[i : j]$ , which will be decomposed into a multibranch loop part  $[i : k]$ , and a stem with enclosing base pair  $(l, j)$ .

## 17.9.2.12 VRNA\_DECOMP\_ML\_COAXIAL

```
#define VRNA_DECOMP_ML_COAXIAL (unsigned char)10
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multi-branch loop part in the interval  $[i : j]$ , where two stems with enclosing pairs  $(i, k)$  and  $(l, j)$  are coaxially stacking onto each other.

## 17.9.2.13 VRNA\_DECOMP\_ML\_COAXIAL\_ENC

```
#define VRNA_DECOMP_ML_COAXIAL_ENC (unsigned char)11
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of multibranch loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates a multi-branch loop part in the interval  $[i : j]$ , where two stems with enclosing pairs  $(i, k)$  and  $(l, j)$  are coaxially stacking onto each other.

## 17.9.2.14 VRNA\_DECOMP\_EXT\_EXT

```
#define VRNA_DECOMP_EXT_EXT (unsigned char)12
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be decomposed into a (usually) smaller exterior loop part  $[k : l]$ .

## 17.9.2.15 VRNA\_DECOMP\_EXT\_UP

```
#define VRNA_DECOMP_EXT_UP (unsigned char)13
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be considered as an exterior loop component consisting of only unpaired nucleotides.

## 17.9.2.16 VRNA\_DECOMP\_EXT\_STEM

```
#define VRNA_DECOMP_EXT_STEM (unsigned char)14
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be considered a stem with enclosing pair  $(k, l)$ .

## 17.9.2.17 VRNA\_DECOMP\_EXT\_EXT\_EXT

```
#define VRNA_DECOMP_EXT_EXT_EXT (unsigned char)15
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be decomposed into two exterior loop parts  $[i : k]$  and  $[l : j]$ .

## 17.9.2.18 VRNA\_DECOMP\_EXT\_STEM\_EXT

```
#define VRNA_DECOMP_EXT_STEM_EXT (unsigned char)16
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be decomposed into a stem branching off with base pair  $(i, k)$ , and an exterior loop part  $[l : j]$ .

## 17.9.2.19 VRNA\_DECOMP\_EXT\_EXT\_STEM

```
#define VRNA_DECOMP_EXT_EXT_STEM (unsigned char)18
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be decomposed into an exterior loop part  $[i : k]$ , and a stem branching off with base pair  $(l, j)$ .

## 17.9.2.20 VRNA\_DECOMP\_EXT\_EXT\_STEM1

```
#define VRNA_DECOMP_EXT_EXT_STEM1 (unsigned char)19
```

```
#include <ViennaRNA/constraints.h>
```

Indicator for decomposition of exterior loop part.

This flag notifies the soft or hard constraint callback function that the current decomposition step evaluates an exterior loop part in the interval  $[i : j]$ , which will be decomposed into an exterior loop part  $[i : k]$ , and a stem branching off with base pair  $(l, j - 1)$ .

## 17.9.3 Function Documentation

## 17.9.3.1 vrna\_constraints\_add()

```
void vrna_constraints_add (
    vrna_fold_compound_t * vc,
    const char * constraint,
    unsigned int options )
```

```
#include <ViennaRNA/constraints.h>
```

Add constraints to a `vrna_fold_compound_t` data structure.

Use this function to add/update the hard/soft constraints. The function allows for passing a string 'constraint' that can either be a filename that points to a constraints definition file or it may be a pseudo dot-bracket notation indicating hard constraints. For the latter, the user has to pass the `VRNA_CONSTRAINT_DB` option. Also, the user has to specify, which characters are allowed to be interpreted as constraints by passing the corresponding options via the third parameter.

VRNA_CONSTRAINT_DB_RND_BRACK, VRNA_CONSTRAINT_DB_INTRAMOL, VRNA_CONSTRAINT_DB_INTERMOL,
VRNA_CONSTRAINT_DB_GQUAD
```

The following is an example for adding hard constraints given in pseudo dot-bracket notation. Here, `vc` is the `vrna_fold_compound_t` object, `structure` is a char array with the hard constraint in dot-bracket notation, and `enforceConstraints` is a flag indicating whether or not constraints for base pairs should be enforced instead of just doing a removal of base pair that conflict with the constraint.

```

unsigned int constraint_options = VRNA_CONSTRAINT_DB_DEFAULT;

if (enforceConstraints)
    constraint_options |= VRNA_CONSTRAINT_DB_ENFORCE_BP;

if (canonicalBPonly)
    constraint_options |= VRNA_CONSTRAINT_DB_CANONICAL_BP;

vrna_constraints_add(vc, (const char *)cstruc, constraint_options);

```

In constrat to the above, constraints may also be read from file:

```

vrna_constraints_add(vc, constraints_file,
VRNA_OPTION_MFE | ((pf) ? VRNA_OPTION_PF : 0));

```

Parameters

<i>vc</i>	The fold compound
<i>constraint</i>	A string with either the filename of the constraint definitions or a pseudo dot-bracket notation of the hard constraint. May be NULL.
<i>options</i>	The option flags

### 17.9.3.2 vrna\_message\_constraint\_options()

```

void vrna_message_constraint_options (
    unsigned int option )

#include <ViennaRNA/constraints_hard.h>

```

Print a help message for pseudo dot-bracket structure constraint characters to stdout. (constraint support is specified by option parameter)

Currently available options are:

[VRNA\\_CONSTRAINT\\_DB\\_PIPE](#) (paired with another base)  
[VRNA\\_CONSTRAINT\\_DB\\_DOT](#) (no constraint at all)  
[VRNA\\_CONSTRAINT\\_DB\\_X](#) (base must not pair)  
[VRNA\\_CONSTRAINT\\_DB\\_ANG\\_BRACK](#) (paired downstream/upstream)  
[VRNA\\_CONSTRAINT\\_DB\\_RND\\_BRACK](#) (base i pairs base j)

pass a collection of options as one value like this:

```
vrna_message_constraints(option_1 | option_2 | option_n)
```

## Parameters

<i>option</i>	Option switch that tells which constraint help will be printed
---------------	--

17.9.3.3 `vrna_message_constraint_options_all()`

```
void vrna_message_constraint_options_all (  
    void )
```

```
#include <ViennaRNA/constraints_hard.h>
```

Print structure constraint characters to stdout (full constraint support)

### 17.10.1 Detailed Description

This module covers all functionality for hard constraints in secondary structure prediction.

## 17.10.2 Data Structure Documentation

### 17.10.2.1 struct vrna\_hc\_s

The hard constraints data structure.

The content of this data structure determines the decomposition pattern used in the folding recursions. Attribute 'matrix' is used as source for the branching pattern of the decompositions during all folding recursions. Any entry in matrix[i,j] consists of the 6 LSB that allows one to distinguish the following types of base pairs:

- in the exterior loop ([VRNA\\_CONSTRAINT\\_CONTEXT\\_EXT\\_LOOP](#))
- enclosing a hairpin ([VRNA\\_CONSTRAINT\\_CONTEXT\\_HP\\_LOOP](#))
- enclosing an interior loop ([VRNA\\_CONSTRAINT\\_CONTEXT\\_INT\\_LOOP](#))
- enclosed by an exterior loop ([VRNA\\_CONSTRAINT\\_CONTEXT\\_INT\\_LOOP\\_ENC](#))
- enclosing a multi branch loop ([VRNA\\_CONSTRAINT\\_CONTEXT\\_MB\\_LOOP](#))
- enclosed by a multi branch loop ([VRNA\\_CONSTRAINT\\_CONTEXT\\_MB\\_LOOP\\_ENC](#))

The four linear arrays 'up\_xxx' provide the number of available unpaired nucleotides (including position i) 3' of each position in the sequence.

```

A pointer to a function to free memory occupied by auxiliary data.

The function this pointer is pointing to will be called upon destruction of the [vrna\\_hc\\_s](#), and provided with the [vrna\\_hc\\_s.data](#) pointer that may hold auxiliary data. Hence, to avoid leaking memory, the user may use this pointer to free memory occupied by auxiliary data.

### 17.10.2.2 struct vrna\_hc\_up\_s

A single hard constraint for a single nucleotide.

## 17.10.3 Macro Definition Documentation

### 17.10.3.1 VRNA\_CONSTRAINT\_DB

```
#define VRNA_CONSTRAINT_DB 16384U  
  
#include <ViennaRNA/constraints_hard.h>
```

Flag for [vrna\\_constraints\\_add\(\)](#) to indicate that constraint is passed in pseudo dot-bracket notation.

```
#define VRNA_CONSTRAINT_DB_ENFORCE_BP 32768U
```

```
#include <ViennaRNA/constraints_hard.h>
```

Switch for dot-bracket structure constraint to enforce base pairs.

This flag should be used to really enforce base pairs given in dot-bracket constraint rather than just weakly-enforcing them.

```
#define VRNA_CONSTRAINT_DB_PIPE 65536U
```

```
#include <ViennaRNA/constraints_hard.h>
```

Flag that is used to indicate the pipe '|' sign in pseudo dot-bracket notation of hard constraints.

Use this definition to indicate the pipe sign '|' (paired with another base)

### 17.10.3.6 VRNA\_CONSTRAINT\_DB\_RND\_BRACK

```
#define VRNA_CONSTRAINT_DB_RND_BRACK 1048576U
```

```
#include <ViennaRNA/constraints_hard.h>
```

round brackets '(',')' switch for structure constraint (base i pairs base j)

### 17.10.3.7 VRNA\_CONSTRAINT\_DB\_INTRAMOL

```
#define VRNA_CONSTRAINT_DB_INTRAMOL 2097152U
```

```
#include <ViennaRNA/constraints_hard.h>
```

Flag that is used to indicate the character 'I' in pseudo dot-bracket notation of hard constraints.

Use this definition to indicate the usage of 'I' character (intramolecular pairs only)

#### See also

### 17.10.3.8 VRNA\_CONSTRAINT\_DB\_INTERMOL

```
#define VRNA_CONSTRAINT_DB_INTERMOL 4194304U
```

```
#include <ViennaRNA/constraints_hard.h>
```

Flag that is used to indicate the character 'e' in pseudo dot-bracket notation of hard constraints.

Use this definition to indicate the usage of 'e' character (intermolecular pairs only)

Warning

This flag is for future purposes only! No implementation recognizes it yet.

### 17.10.3.10 VRNA\_CONSTRAINT\_DB\_WUSS

```
#define VRNA_CONSTRAINT_DB_WUSS 33554432U
```

```
#include <ViennaRNA/constraints_hard.h>
```

Flag to indicate Washington University Secondary Structure (WUSS) notation of the hard constraint string.

This secondary structure notation for RNAs is usually used as consensus secondary structure (SS\_cons) entry in Stockholm formatted files

Note

See

### 17.10.3.11 VRNA\_CONSTRAINT\_DB\_DEFAULT

```
#define VRNA_CONSTRAINT_DB_DEFAULT

#include <ViennaRNA/constraints_hard.h>
```

**Value:**

```
(VRNA_CONSTRAINT_DB \
 | VRNA_CONSTRAINT_DB_PIPE \
 | VRNA_CONSTRAINT_DB_DOT \
 | VRNA_CONSTRAINT_DB_X \
 | VRNA_CONSTRAINT_DB_ANG_BRACK \
 | VRNA_CONSTRAINT_DB_RND_BRACK \
 | VRNA_CONSTRAINT_DB_INTRAMOL \
 | VRNA_CONSTRAINT_DB_INTERMOL \
 | VRNA_CONSTRAINT_DB_GQUAD \
)
```

Switch for dot-bracket structure constraint with default symbols.

This flag conveniently combines all possible symbols in dot-bracket notation for hard constraints and [VRNA\\_CONSTRAINT\\_DB](#)

## 17.10.4 Typedef Documentation

### 17.10.4.1 vrna\_callback\_hc\_evaluate

```
typedef unsigned char() vrna_callback_hc_evaluate(int i, int j, int k, int l, unsigned char d,
void *data)
```

```
#include <ViennaRNA/constraints_hard.h>
```

Callback to evaluate whether or not a particular decomposition step is contributing to the solution space.

This is the prototype for callback functions used by the folding recursions to evaluate generic hard constraints. The first four parameters passed indicate the delimiting nucleotide positions of the decomposition, and the parameter `denotes` the decomposition step. The last parameter `data` is the auxiliary data structure associated to the hard constraints via [vrna\\_hc\\_add\\_data\(\)](#), or NULL if no auxiliary data was added.

**Notes on Callback Functions** This callback enables one to over-rule default hard constraints in secondary structure decompositions.

## Parameters

<i>i</i>	Left (5') delimiter position of substructure
<i>j</i>	Right (3') delimiter position of substructure
<i>k</i>	Left delimiter of decomposition
<i>l</i>	Right delimiter of decomposition
<i>d</i>	Decomposition step indicator
<i>data</i>	Auxiliary data

## Returns

A non-zero value if the decomposition is valid, 0 otherwise

## 17.10.5 Function Documentation

17.10.5.1 `vrna_hc_init()`

```
void vrna_hc_init (
    vrna_fold_compound_t * vc )

#include <ViennaRNA/constraints_hard.h>
```

Initialize/Reset hard constraints to default values.

This function resets the hard constraints to their default values, i.e. all positions may be unpaired in all contexts, and base pairs are allowed in all contexts, if they resemble canonical pairs. Previously set hard constraints will be removed before initialization.

    vrna_fold_compound_t * vc,
    vrna_hc_up_t * constraints )
```

```
#include <ViennaRNA/constraints_hard.h>
```

Apply a list of hard constraints for single nucleotides.

Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> the hard constraints are associated with
<i>constraints</i>	The list off constraints to apply, last entry must have position attribute set to 0

#### 17.10.5.4 vrna\_hc\_add\_bp()

```
void vrna_hc_add_bp (
    vrna_fold_compound_t * vc,
    int i,
    int j,

Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> the hard constraints are associated with
<i>i</i>	The 5' located nucleotide position of the base pair (1-based)
<i>j</i>	The 3' located nucleotide position of the base pair (1-based)
<i>option</i>	The options flag indicating how/where to store the hard constraints

#### 17.10.5.5 vrna\_hc\_add\_bp\_nonspecific()

```
void vrna_hc_add_bp_nonspecific (
    vrna_fold_compound_t * vc,
    int i,
    int d,
    unsigned char option )
```

```

Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> the hard constraints are associated with
<i>i</i>	The position that needs to stay unpaired (1-based)
<i>d</i>	The direction of base pairing ( $d < 0$ : pairs upstream, $d > 0$ : pairs downstream, $d == 0$ : no direction)
<i>option</i>	The options flag indicating in which loop type context the pairs may appear

#### 17.10.5.6 vrna\_hc\_free()

```
void vrna_hc_free (
    vrna_hc_t * hc )
```

```
#include <ViennaRNA/constraints_hard.h>
```

Free the memory allocated by a [vrna\\_hc\\_t](#) data structure.

Use this function to free all memory that was allocated for a data structure of type [vrna\\_hc\\_t](#).

## 17.11.3 Typedef Documentation

### 17.11.3.1 vrna\_callback\_sc\_energy

```
typedef int() vrna_callback_sc_energy(int i, int j, int k, int l, unsigned char d, void *data)
```

```
#include <ViennaRNA/constraints_soft.h>
```

Callback to retrieve pseudo energy contribution for soft constraint feature.

This is the prototype for callback functions used by the folding recursions to evaluate generic soft constraints. The first four parameters passed indicate the delimiting nucleotide positions of the decomposition, and the parameter `denotes` the decomposition step. The last parameter `data` is the auxiliary data structure associated to the hard constraints via [vrna\\_sc\\_add\\_data\(\)](#), or NULL if no auxiliary data was added.

**Notes on Callback Functions** This callback enables one to add (pseudo-)energy contributions to individual decompositions of the secondary structure.

## Parameters

<i>i</i>	Left (5') delimiter position of substructure
<i>j</i>	Right (3') delimiter position of substructure
<i>k</i>	Left delimiter of decomposition
<i>l</i>	Right delimiter of decomposition
<i>d</i>	Decomposition step indicator
<i>data</i>	Auxiliary data

## Returns

Pseudo energy contribution in deka-kalories per mol

17.11.3.2 `vrna_callback_sc_exp_energy`

```
typedef FLT_OR_DBL() vrna_callback_sc_exp_energy(int i, int j, int k, int l, unsigned char d,
void *data)
```

```
#include <ViennaRNA/constraints_soft.h>
```

Callback to retrieve pseudo energy contribution as Boltzmann Factors for soft constraint feature.

This is the prototype for callback functions used by the partition function recursions to evaluate generic soft constraints. The first four parameters passed indicate the delimiting nucleotide positions of the decomposition, and the parameter `denotes` the decomposition step. The last parameter `data` is the auxiliary data structure associated to the hard constraints via `vrna_sc_add_data()`, or NULL if no auxiliary data was added.

**Notes on Callback Functions** This callback enables one to add (pseudo-)energy contributions to individual decompositions of the secondary structure (Partition function variant, i.e. contributions must be returned as Boltzmann factors).

**17.11.4 Function Documentation****17.11.4.1 vrna\_sc\_init()**

```
void vrna_sc_init (
    vrna_fold_compound_t * vc )
```

```
#include <ViennaRNA/constraints_soft.h>
```

Initialize an empty soft constraints data structure within a `vrna_fold_compound_t`.

This function adds a proper soft constraints data structure to the `vrna_fold_compound_t` data structure. If soft constraints already exist within the fold compound, they are removed.

#### Note

Accepts `vrna_fold_compound_t` of type `VRNA_FC_TYPE_SINGLE` and `VRNA_FC_TYPE_COMPARATIVE`

```

Bind a backtracking function pointer for generic soft constraint feature.

This function allows one to easily bind a function pointer to the soft constraint part `vrna_sc_t` of the `vrna_fold_compound_t`. The provided function should be used for backtracking purposes in loop regions that were altered via the generic soft constraint feature. It has to return an array of `vrna_basepair_t` data structures, where the last element in the list is indicated by a value of -1 in its `i` position.

#### 17.13.1 Detailed Description

Compute Minimum Free energy (MFE) and backtrace corresponding secondary structures from RNA sequence data.

The library provides a fast dynamic programming minimum free energy folding algorithm as described in [24]. All relevant parts that directly implement the "Zuker & Stiegler" algorithm for single sequences are described in this section.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [9] for further details.

Nevertheless, the **RNALib** also provides interfaces for the prediction of consensus MFE structures of sequence alignments, MFE structure for two hybridized sequences, local optimal structures and many more. For those more specialized variants of MFE folding routines, please consult the appropriate subsections (Modules) as listed above.

## 17.13.2 Typedef Documentation

### 17.13.2.1 vrna\_mfe\_window\_callback

```
typedef void() vrna_mfe_window_callback(int start, int end, const char *structure, float en, void *data)
```

```
#include <ViennaRNA/mfe.h>
```

The default callback for sliding window MFE structure predictions.

**Notes on Callback Functions** This function will be called for each hit in a sliding window MFE prediction.

See also

[vrna\\_mfe\\_window\(\)](#)

#### Parameters

<i>start</i>	provides the first position of the hit (1-based, relative to entire sequence/alignment)
<i>end</i>	provides the last position of the hit (1-based, relative to the entire sequence/alignment)
<i>structure</i>	provides the (sub)structure in dot-bracket notation
<i>en</i>	is the free energy of the structure hit in kcal/mol
<i>data</i>	is some arbitrary data pointer passed through by the function executing the callback

## 17.13.3 Function Documentation

### 17.13.3.1 vrna\_mfe()

```
float vrna_mfe (
    vrna_fold_compound_t * vc,
    char * structure )
```

```
#include <ViennaRNA/mfe.h>
```

Compute minimum free energy and an appropriate secondary structure of an RNA sequence, or RNA sequence alignment.

Depending on the type of the provided [vrna\\_fold\\_compound\\_t](#), this function predicts the MFE for a single sequence, or a corresponding averaged MFE for a sequence alignment. If backtracking is activated, it also constructs the corresponding secondary structure, or consensus structure. Therefore, the second parameter, *structure*, has to point to an allocated block of memory with a size of at least `strlen(sequence) + 1` to store the backtracked MFE structure. (For consensus structures, this is the length of the alignment + 1. If `NULL` is passed, no backtracking will be performed.

**Note**

This function is polymorphic. It accepts `vrna_fold_compound_t` of type `VRNA_FC_TYPE_SINGLE`, and `VRNA_FC_TYPE_COMPARATIVE`.

**Parameters**

<i>vc</i>	fold compound
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to (Maybe NULL)

**Returns**

the minimum free energy (MFE) in kcal/mol

### 17.14.1 Detailed Description

Compute the partition function and various equilibrium properties derived from it.

Instead of the minimum free energy structure the partition function of all possible structures and from that the pairing probability for every possible pair can be calculated, using a dynamic programming algorithm as described in [15].

### 17.14.2 Function Documentation

#### 17.14.2.1 `vrna_mean_bp_distance_pr()`

```
double vrna_mean_bp_distance_pr (
    int length,
    FLT_OR_DBL * pr )

#include <ViennaRNA/equilibrium_probs.h>
```

Get the mean base pair distance in the thermodynamic ensemble from a probability matrix.

$\langle d \rangle = \sum_{a,b} p_a p_b d(S_a, S_b)$   
 this can be computed from the pair probs  $p_{ij}$  as  
 $\langle d \rangle = \sum_{i,j} p_{ij} (1 - p_{ij})$

## Parameters

<i>length</i>	The length of the sequence
<i>pr</i>	The matrix containing the base pair probabilities

## Returns

The mean pair distance of the structure ensemble

17.14.2.2 `vrna_mean_bp_distance()`

```
double vrna_mean_bp_distance (
    vrna_fold_compound_t * vc )

#include <ViennaRNA/equilibrium_probs.h>
```

Get the mean base pair distance in the thermodynamic ensemble.

$\langle d \rangle = \sum_{a,b} p_a p_b d(S_a, S_b)$   
 this can be computed from the pair probs  $p_{ij}$  as  
 $\langle d \rangle = \sum_{ij} p_{ij} (1 - p_{ij})$

## Parameters

<i>vc</i>	The fold compound data structure
-----------	----------------------------------

## Returns

The mean pair distance of the structure ensemble

**SWIG Wrapper Notes** This function is attached as method `mean_bp_distance()` to objects of type `fold_compound`

17.14.2.3 `vrna_stack_prob()`

```
vrna_ep_t* vrna_stack_prob (
    vrna_fold_compound_t * vc,
    double cutoff )

#include <ViennaRNA/equilibrium_probs.h>
```

Compute stacking probabilities.

For each possible base pair  $(i, j)$ , compute the probability of a stack  $(i, j)$ ,  $(i + 1, j - 1)$ .

## Parameters

<i>vc</i>	The fold compound data structure with precomputed base pair probabilities
<i>cutoff</i>	A cutoff value that limits the output to stacks with $p > \text{cutoff}$ .

## Returns

A list of stacks with enclosing base pair  $(i, j)$  and probability  $p$

17.14.2.4 `vrna_pf()`

```
float vrna_pf (
    vrna_fold_compound_t * vc,
    char * structure )

#include <ViennaRNA/part_func.h>
```

Compute the partition function  $Q$  for a given RNA sequence, or sequence alignment.

If *structure* is not a NULL pointer on input, it contains on return a string consisting of the letters ". , | { } ( ) " denoting bases that are essentially unpaired, weakly paired, strongly paired without preference, weakly upstream (downstream) paired, or strongly up- (down-)stream paired bases, respectively. If the parameter `calculate_bppm` is set to 0 base pairing probabilities will not be computed (saving CPU time), otherwise after calculations took place *pr* will contain the probability that bases  $i$  and  $j$  pair.

## Note

This function is polymorphic. It accepts `vrna_fold_compound_t` of type `VRNA_FC_TYPE_SINGLE`, and `VRNA_FC_TYPE_COMPARATIVE`.

## Parameters

<i>in, out</i>	<i>vc</i>	The fold compound data structure
<i>in, out</i>	<i>structure</i>	A pointer to the character array where position-wise pairing propensity will be stored. (Maybe NULL)

## Returns

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**SWIG Wrapper Notes** This function is attached as method **pf()** to objects of type *fold\_compound*

17.14.2.5 `vrna_pf_fold()`

```
float vrna_pf_fold (
    const char * sequence,
    char * structure,
    vrna_ep_t ** pl )

#include <ViennaRNA/part_func.h>
```

Compute Partition function  $Q$  (and base pair probabilities) for an RNA sequence using a comparative method.

This simplified interface to `vrna_pf()` computes the partition function and, if required, base pair probabilities for an RNA sequence using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing.

**Note**

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use `vrna_pf()`, and the data structure `vrna_fold_compound_t` instead.

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where position-wise pairing propensity will be stored. (Maybe NULL)
<i>pl</i>	A pointer to a list of <a href="#">vrna_ep_t</a> to store pairing probabilities (Maybe NULL)

**Returns**

The Gibbs free energy of the ensemble (  $G = -RT \cdot \log(Q)$  ) in kcal/mol

17.14.2.6 `vrna_pf_circfold()`

```
float vrna_pf_circfold (
    const char * sequence,
    char * structure,
    vrna_ep_t ** pl )

#include <ViennaRNA/part_func.h>
```

Compute Partition function  $Q$  (and base pair probabilities) for a circular RNA sequences using a comparative method.

This simplified interface to `vrna_pf()` computes the partition function and, if required, base pair probabilities for a circular RNA sequence using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing.

**Note**

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_pf\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [9] for further details.

**See also**

[vrna\\_pf\\_fold\(\)](#), [vrna\\_pf\(\)](#), [vrna\\_fold\\_compound\(\)](#), [vrna\\_fold\\_compound\\_t](#)

**Parameters**

<i>sequence</i>	A circular RNA sequence
<i>structure</i>	A pointer to the character array where position-wise pairing propensity will be stored. (Maybe NULL)
<i>pl</i>	A pointer to a list of <a href="#">vrna_ep_t</a> to store pairing probabilities (Maybe NULL)

**Returns**

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**17.14.2.7 pf\_fold\_par()**

```
float pf_fold_par (
    const char * sequence,
    char * structure,
    vrna_exp_param_t * parameters,
    int calculate_bppm,
    int is_constrained,
    int is_circular )
```

```
#include <ViennaRNA/part_func.h>
```

Compute the partition function  $Q$  for a given RNA sequence.

If *structure* is not a NULL pointer on input, it contains on return a string consisting of the letters ". , | { } ( )" denoting bases that are essentially unpaired, weakly paired, strongly paired without preference, weakly upstream (downstream) paired, or strongly up- (down-)stream paired bases, respectively. If [fold\\_constrained](#) is not 0, the *structure* string is interpreted on input as a list of constraints for the folding. The character "x" marks bases that must be unpaired, matching brackets " ( )" denote base pairs, all other characters are ignored. Any pairs conflicting with the constraint will be forbidden. This is usually sufficient to ensure the constraints are honored. If the parameter *calculate\_bppm* is set to 0 base pairing probabilities will not be computed (saving CPU time), otherwise after calculations took place *pr* will contain the probability that bases *i* and *j* pair.

**Deprecated** Use [vrna\\_pf\(\)](#) instead

**Note**

The global array `pr` is deprecated and the user who wants the calculated base pair probabilities for further computations is advised to use the function `export_bppm()`

**Postcondition**

After successful run the hidden folding matrices are filled with the appropriate Boltzmann factors. Depending on whether the global variable `do_backtrack` was set the base pair probabilities are already computed and may be accessed for further usage via the `export_bppm()` function. A call of `free_pf_arrays()` will free all memory allocated by this function. Successive calls will first free previously allocated memory before starting the computation.

**See also**

`vrna_pf()`, `bppm_to_structure()`, `export_bppm()`, `vrna_exp_params()`, `free_pf_arrays()`

**Parameters**

in	<i>sequence</i>	The RNA sequence input
in, out	<i>structure</i>	A pointer to a char array where a base pair probability information can be stored in a pseudo-dot-bracket notation (may be NULL, too)
in	<i>parameters</i>	Data structure containing the precalculated Boltzmann factors
in	<i>calculate_bppm</i>	Switch to Base pair probability calculations on/off (0==off)
in	<i>is_constrained</i>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)
in	<i>is_circular</i>	Switch to (de-)activate postprocessing steps in case RNA sequence is circular (0==off)

**Returns**

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**17.14.2.8 pf\_fold()**

```
float pf_fold (
    const char * sequence,
    char * structure )

#include <ViennaRNA/part_func.h>
```

Compute the partition function  $Q$  of an RNA sequence.

If *structure* is not a NULL pointer on input, it contains on return a string consisting of the letters ". , | { } ( ) " denoting bases that are essentially unpaired, weakly paired, strongly paired without preference, weakly upstream (downstream) paired, or strongly up- (down-)stream paired bases, respectively. If `fold_constrained` is not 0, the *structure* string is interpreted on input as a list of constraints for the folding. The character "x" marks bases that must be unpaired, matching brackets "( )" denote base pairs, all other characters are ignored. Any pairs conflicting with the constraint will be forbidden. This is usually sufficient to ensure the constraints are honored. If `do_backtrack` has been set to 0 base pairing probabilities will not be computed (saving CPU time), otherwise `pr` will contain the probability that bases  $i$  and  $j$  pair.

**Note**

The global array `pr` is deprecated and the user who wants the calculated base pair probabilities for further computations is advised to use the function `export_bppm()`.

**OpenMP:** This function is not entirely threadsafe. While the recursions are working on their own copies of data the model details for the recursions are determined from the global settings just before entering the recursions. Consider using `pf_fold_par()` for a really threadsafe implementation.

**Precondition**

This function takes its model details from the global variables provided in *RNAlib*

**Postcondition**

After successful run the hidden folding matrices are filled with the appropriate Boltzmann factors. Depending on whether the global variable `do_backtrack` was set the base pair probabilities are already computed and may be accessed for further usage via the `export_bppm()` function. A call of `free_pf_arrays()` will free all memory allocated by this function. Successive calls will first free previously allocated memory before starting the computation.

**Parameters**

<i>sequence</i>	The RNA sequence input
<i>structure</i>	A pointer to a char array where a base pair probability information can be stored in a pseudo-dot-bracket notation (may be NULL, too)

**Returns**

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

**17.14.2.9 pf\_circ\_fold()**

```
float pf_circ_fold (
    const char * sequence,
    char * structure )

#include <ViennaRNA/part_func.h>
```

Compute the partition function of a circular RNA sequence.

**Note**

**17.14.2.10 free\_pf\_arrays()**

```
void free_pf_arrays (
    void )

#include <ViennaRNA/part_func.h>
```

Free arrays for the partition function recursions.

Call this function if you want to free all allocated memory associated with the partition function forward recursion.

**Note**

Successive calls of [pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#) already check if they should free any memory from a previous run.

**OpenMP notice:**

This function should be called before leaving a thread in order to avoid leaking memory

### 17.14.2.11 update\_pf\_params()

```
void update_pf_params (
    int length )
```

```
#include <ViennaRNA/part_func.h>
```

Recalculate energy parameters.

Call this function to recalculate the pair matrix and energy parameters after a change in folding parameters like [temperature](#)

**Deprecated** Use [vrna\\_exp\\_params\\_subst\(\)](#) instead

### 17.14.2.12 update\_pf\_params\_par()

```

### 17.14.2.13 export\_bppm()

```
FLT_OR_DBL* export_bppm (
    void )
```

```
#include <ViennaRNA/part_func.h>
```

Get a pointer to the base pair probability array

Accessing the base pair probabilities for a pair (i,j) is achieved by.

```
FLT_OR_DBL *pr = export_bppm();
pr_ij         = pr[iindx[i]-j];
```

#### Precondition

Call [pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#) or [pf\\_circ\\_fold\(\)](#) first to fill the base pair probability array

#### See also

[pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#), [vrna\\_idx\\_row\\_wise\(\)](#)

#### Returns

A pointer to the base pair probability array

### 17.14.2.14 get\_pf\_arrays()

```
int get_pf_arrays (
    short ** S_p,
    short ** S1_p,
    char ** ptype_p,
    FLT_OR_DBL ** qb_p,
    FLT_OR_DBL ** qm_p,
    FLT_OR_DBL ** q1k_p,
    FLT_OR_DBL ** qln_p )

#include <ViennaRNA/part_func.h>
```

Get the pointers to (almost) all relevant computation arrays used in partition function computation.

#### Precondition

In order to assign meaningful pointers, you have to call [pf\\_fold\\_par\(\)](#) or [pf\\_fold\(\)](#) first!

#### See also

[pf\\_fold\\_par\(\)](#), [pf\\_fold\(\)](#), [pf\\_circ\\_fold\(\)](#)

#### Parameters

out	<i>S_p</i>	A pointer to the 'S' array (integer representation of nucleotides)
out	<i>S1_p</i>	A pointer to the 'S1' array (2nd integer representation of nucleotides)
out	<i>ptype</i> <sub>← _p</sub>	A pointer to the pair type matrix
out	<i>qb_p</i>	A pointer to the $Q^B$ matrix
out	<i>qm_p</i>	A pointer to the $Q^M$ matrix
out	<i>q1k_p</i>	A pointer to the 5' slice of the Q matrix ( $q1k(k) = Q(1, k)$ )
out	<i>qln_p</i>	A pointer to the 3' slice of the Q matrix ( $qln(l) = Q(l, n)$ )

#### Returns

Non Zero if everything went fine, 0 otherwise

### 17.14.2.15 mean\_bp\_distance()

```
double mean_bp_distance (
    int length )

#include <ViennaRNA/part_func.h>
```

Get the mean base pair distance of the last partition function computation.

**Deprecated** Use [vrna\\_mean\\_bp\\_distance\(\)](#) or [vrna\\_mean\\_bp\\_distance\\_pr\(\)](#) instead!

#### See also

[vrna\\_mean\\_bp\\_distance\(\)](#), [vrna\\_mean\\_bp\\_distance\\_pr\(\)](#)

## Parameters

<i>length</i>	
---------------	--

## Returns

mean base pair distance in thermodynamic ensemble

## 17.14.2.16 mean\_bp\_distance\_pr()

```
double mean_bp_distance_pr (
    int length,
    FLT_OR_DBL * pr )
```

```
#include <ViennaRNA/part_func.h>
```

Get the mean base pair distance in the thermodynamic ensemble.

This is a threadsafe implementation of [mean\\_bp\\_dist\(\)](#) !

$$\langle d \rangle = \sum_{a,b} p_a p_b d(S_a, S_b)$$

this can be computed from the pair probs  $p_{ij}$  as

$$\langle d \rangle = \sum_{ij} p_{ij} (1 - p_{ij})$$

**Deprecated** Use [vrna\\_mean\\_bp\\_distance\(\)](#) or [vrna\\_mean\\_bp\\_distance\\_pr\(\)](#) instead!

## Parameters

<i>length</i>	The length of the sequence
<i>pr</i>	The matrix containing the base pair probabilities

## Returns

The mean pair distance of the structure ensemble

## 17.14.2.17 vrna\_plist\_from\_probs()

```
vrna_ep_t* vrna_plist_from_probs (
    vrna_fold_compound_t * vc,
    double cut_off )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a [vrna\\_ep\\_t](#) from base pair probability matrix.

The probability matrix provided via the [vrna\\_fold\\_compound\\_t](#) is parsed and all pair probabilities above the given threshold are used to create an entry in the plist

The end of the plist is marked by sequence positions  $i$  as well as  $j$  equal to 0. This condition should be used to stop looping over its entries

## Parameters

in	<i>vc</i>	The fold compound
in	<i>cut_off</i>	The cutoff value

## Returns

A pointer to the plist that is to be created

17.14.2.18 `assign_plist_from_pr()`

```
void assign_plist_from_pr (
    vrna_ep_t ** pl,
    FLT_OR_DBL * probs,
    int length,
    double cutoff )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a `vrna_ep_t` from a probability matrix.

The probability matrix given is parsed and all pair probabilities above the given threshold are used to create an entry in the plist

The end of the plist is marked by sequence positions *i* as well as *j* equal to 0. This condition should be used to stop looping over its entries

## Note

This function is threadsafe

**Deprecated** Use `vrna_plist_from_probs()` instead!

## Parameters

out	<i>pl</i>	A pointer to the <code>vrna_ep_t</code> that is to be created
in	<i>probs</i>	The probability matrix used for creating the plist
in	<i>length</i>	The length of the RNA sequence
in	<i>cutoff</i>	The cutoff value

```
vrna_subopt_solution_t * vrna_subopt_zuker (

```

```
#include <ViennaRNA/subopt.h>
```

Compute Zuker type suboptimal structures.

Compute Suboptimal structures according to M. Zuker [23] , i.e. for every possible base pair the minimum energy structure containing the resp. base pair. Returns a list of these structures and their energies.

#### Note

This function internally uses the cofold implementation to compute the suboptimal structures. For that purpose, the function doubles the sequence and enlarges the DP matrices, which in fact will grow by a factor of 4 during the computation! At the end of the structure prediction, everything will be re-set to its original requirements, i.e. normal sequence, normal (empty) DP matrices.

**Bug** Due to resizing, any pre-existing constraints will be lost!

[vrna\\_subopt\\_cb\(\)](#)

## Parameters

<i>structure</i>	The suboptimal secondary structure in dot-bracket notation
<i>energy</i>	The free energy of the secondary structure in kcal/mol
<i>data</i>	Some arbitrary, auxiliary data address as passed to <a href="#">vrna_subopt_cb()</a>

## 17.17.3 Function Documentation

17.17.3.1 [vrna\\_subopt\(\)](#)

```
vrna_subopt_solution_t * vrna_subopt (
    vrna_fold_compound_t * vc,
    int delta,
    int sorted,
    FILE * fp )
```

```
#include <ViennaRNA/subopt.h>
```

Returns list of subopt structures or writes to fp.

This function produces **all** suboptimal secondary structures within 'delta' \* 0.01 kcal/mol of the optimum, see [21]. The results are either directly written to a 'fp' (if 'fp' is not NULL), or (fp==NULL) returned in a [vrna\\_subopt\\_solution\\_t](#) \* list terminated by an entry where the 'structure' member is NULL.

## Note

This function requires all multibranch loop DP matrices for unique multibranch loop backtracing. Therefore, the supplied [vrna\\_fold\\_compound\\_t](#) *vc* (argument 1) must be initialized with [vrna\\_md\\_t.uniq\\_ML](#) = 1, for instance like this:

```
vrna_md_t md;
vrna_md_set_default (&md);
md.uniq_ML = 1;

vrna_fold_compound_t *vc=vrna_fold_compound("GGGGGAAAAACCCCC", &md
    , VRNA_OPTION_DEFAULT);
```

## See also

[vrna\\_subopt\\_cb\(\)](#), [vrna\\_subopt\\_zuker\(\)](#)

## Parameters

<i>vc</i>	
<i>delta</i>	
<i>sorted</i>	Sort results by energy in ascending order
<i>fp</i>	

## Returns

**SWIG Wrapper Notes** This function is attached as method **subopt()** to objects of type *fold\_compound*

## 17.17.3.2 vrna\_subopt\_cb()

```
void vrna_subopt_cb (
    vrna_fold_compound_t * vc,
    int delta,
    vrna_subopt_callback * cb,
    void * data )
```

```
#include <ViennaRNA/subopt.h>
```

Generate suboptimal structures within an energy band around the MFE.

This is the most generic implementation of the suboptimal structure generator according to Wuchty et al. 1999 [21]. Identical to **vrna\_subopt()**, it computes all secondary structures within an energy band *delta* around the MFE. However, this function does not print the resulting structures and their corresponding free energies to a file pointer, or returns them as a list. Instead, it calls a user-provided callback function which it passes the structure in dot-bracket format, the corresponding free energy in kcal/mol, and a user-provided data structure each time a structure was backtracked successfully. This function indicates the final output, i.e. the end of the backtracking procedure by passing NULL instead of an actual dot-bracket string to the callback.

## Note

This function requires all multibranch loop DP matrices for unique multibranch loop backtracing. Therefore, the supplied **vrna\_fold\_compound\_t** *vc* (argument 1) must be initialized with **vrna\_md\_t.uniq\_ML** = 1, for instance like this:

```
vrna_md_t md;
vrna_md_set_default (&md);
md.uniq_ML = 1;

vrna_fold_compound_t *vc=vrna_fold_compound("GGGGGGAAAAACCCCC", &md
    , VRNA_OPTION_DEFAULT);
```

## See also

**vrna\_subopt\_callback**, **vrna\_subopt()**, **vrna\_subopt\_zuker()**

## Parameters

<i>vc</i>	fold compount with the sequence data
<i>delta</i>	Energy band around the MFE in 10cal/mol, i.e. deka-calories
<i>cb</i>	Pointer to a callback function that handles the backtracked structure and its free energy in kcal/mol
<i>data</i>	Pointer to some data structure that is passed along to the callback

**SWIG Wrapper Notes** This function is attached as method **subopt\_cb()** to objects of type *fold\_compound*

### 17.17.3.3 subopt()

```
SOLUTION* subopt (
    char * seq,
    char * structure,
    int delta,
    FILE * fp )

#include <ViennaRNA/subopt.h>
```

Returns list of subopt structures or writes to fp.

This function produces **all** suboptimal secondary structures within 'delta' \* 0.01 kcal/mol of the optimum. The results are either directly written to a 'fp' (if 'fp' is not NULL), or (fp==NULL) returned in a **SOLUTION** \* list terminated by an entry where the 'structure' pointer is NULL.

#### Parameters

<i>seq</i>	
<i>structure</i>	
<i>delta</i>	
<i>fp</i>	

#### Returns

### 17.17.3.4 subopt\_circ()

```
SOLUTION* subopt_circ (
    char * seq,
    char * sequence,
    int delta,
    FILE * fp )

#include <ViennaRNA/subopt.h>
```

Returns list of circular subopt structures or writes to fp.

This function is similar to [subopt\(\)](#) but calculates secondary structures assuming the RNA sequence to be circular instead of linear

#### Parameters

<i>seq</i>	
<i>sequence</i>	
<i>delta</i>	
<i>fp</i>	

Returns

### 17.18.1 Detailed Description

### 17.18.2 Function Documentation

#### 17.18.2.1 vrna\_pbacktrack5()

```
char * vrna_pbacktrack5 (
    vrna_fold_compound_t * vc,
    int length )

#include <ViennaRNA/boltzmann_sampling.h>
```

Sample a secondary structure of a subsequence from the Boltzmann ensemble according its probability.

#### Precondition

Unique multiloop decomposition has to be active upon creation of `vc` with `vrna_fold_compound()` or similar. This can be done easily by passing `vrna_fold_compound()` a model details parameter with `vrna_md_t.uniq_ML = 1`. `vrna_pf()` has to be called first to fill the partition function matrices

## Parameters

<i>vc</i>	The fold compound data structure
<i>length</i>	The length of the subsequence to consider (starting with 5' end)

## Returns

A sampled secondary structure in dot-bracket notation (or NULL on error)

**SWIG Wrapper Notes** This function is attached as overloaded method **pbacktrack()** to objects of type *fold\_compound*

17.18.2.2 *vrna\_pbacktrack()*

```
char * vrna_pbacktrack (
    vrna_fold_compound_t * vc )

#include <ViennaRNA/boltzmann_sampling.h>
```

Sample a secondary structure (consensus structure) from the Boltzmann ensemble according its probability.

## Precondition

Unique multiloop decomposition has to be active upon creation of *vc* with *vrna\_fold\_compound()* or similar. This can be done easily by passing *vrna\_fold\_compound()* a model details parameter with *vrna\_md\_t.uniq\_ML* = 1. *vrna\_pf()* has to be called first to fill the partition function matrices

## Note

This function is polymorphic. It accepts *vrna\_fold\_compound\_t* of type *VRNA\_FC\_TYPE\_SINGLE*, and *VRNA\_FC\_TYPE\_COMPARATIVE*. The function will automagically detect cicular RNAs based on the *model\_details* in *exp\_params* as provided via the *vrna\_fold\_compound\_t*

## Parameters

<i>vc</i>	The fold compound data structure
-----------	----------------------------------

## Returns

A sampled secondary structure in dot-bracket notation (or NULL on error)

**SWIG Wrapper Notes** This function is attached as overloaded method **pbacktrack()** to objects of type *fold\_compound* that accepts an optional *length* argument. Hence, it serves as a replacement for *vrna\_pbacktrack()*.

### 17.18.2.3 pbacktrack()

```
char* pbacktrack (
    char * sequence )
```

```
#include <ViennaRNA/part_func.h>
```

Sample a secondary structure from the Boltzmann ensemble according its probability.

#### Precondition

[st\\_back](#) has to be set to 1 before calling [pf\\_fold\(\)](#) or [pf\\_fold\\_par\(\)](#)  
[pf\\_fold\\_par\(\)](#) or [pf\\_fold\(\)](#) have to be called first to fill the partition function matrices

#### Parameters

<i>sequence</i>	The RNA sequence
-----------------	------------------

#### Returns

A sampled secondary structure in dot-bracket notation

### 17.18.2.4 pbacktrack\_circ()

```
char* pbacktrack_circ (
    char * sequence )
```

```
#include <ViennaRNA/part_func.h>
```

Sample a secondary structure of a circular RNA from the Boltzmann ensemble according its probability.

This function does the same as [pbacktrack\(\)](#) but assumes the RNA molecule to be circular

#### Precondition

[st\\_back](#) has to be set to 1 before calling [pf\\_fold\(\)](#) or [pf\\_fold\\_par\(\)](#)  
[pf\\_fold\\_par\(\)](#) or [pf\\_circ\\_fold\(\)](#) have to be called first to fill the partition function matrices

**Deprecated** Use [vrna\\_pbacktrack\(\)](#) instead.

#### Parameters

<i>sequence</i>	The RNA sequence
-----------------	------------------

#### Returns

A sampled secondary structure in dot-bracket notation

### 17.18.3 Variable Documentation

#### 17.18.3.1 `st_back`

```
int st_back
```

```
#include <ViennaRNA/part_func.h>
```

Flag indicating that auxiliary arrays are needed throughout the computations. This is essential for stochastic backtracking.

Set this variable to 1 prior to a call of `pf_fold()` to ensure that all matrices needed for stochastic backtracking are filled in the forward recursions

**Deprecated** set the `uniq_ML` flag in `vrna_md_t` before passing it to `vrna_fold_compound()`.

### 17.19.1 Detailed Description

### 17.19.2 Function Documentation

#### 17.19.2.1 MEA()

```
float MEA (
    plist * p,
    char * structure,
    double gamma )

#include <ViennaRNA/MEA.h>
```

Computes a MEA (maximum expected accuracy) structure.

The algorithm maximizes the expected accuracy

$$A(S) = \sum_{(i,j) \in S} 2\gamma p_{ij} + \sum_{i \notin S} p_i^u$$

Higher values of  $\gamma$  result in more base pairs of lower probability and thus higher sensitivity. Low values of  $\gamma$  result in structures containing only highly likely pairs (high specificity). The code of the MEA function also demonstrates the use of sparse dynamic programming scheme to reduce the time and memory complexity of folding.

```
char* vrna_centroid (
    vrna_fold_compound_t * vc,
    double * dist )
```

```
#include <ViennaRNA/centroid.h>
```

Get the centroid structure of the ensemble.

The centroid is the structure with the minimal average distance to all other structures

$$< d(S) > = \sum_{(i,j) \in S} (1 - p_{ij}) + \sum_{(i,j) \notin S} p_{ij}$$

Thus, the centroid is simply the structure containing all pairs with  $p_{ij} > 0.5$ . The distance of the centroid to the ensemble is written to the memory addressed by *dist*.

#### Parameters

in	<i>vc</i>	The fold compound data structure
out	<i>dist</i>	A pointer to the distance variable where the centroid distance will be written to

#### Returns

The centroid structure of the ensemble in dot-bracket notation

## 17.20.2.2 vrna\_centroid\_from\_plist()

```
char* vrna_centroid_from_plist (
    int length,
    double * dist,
    vrna_ep_t * pl )

#include <ViennaRNA/centroid.h>
```

Get the centroid structure of the ensemble.

This function is a threadsafe replacement for [centroid\(\)](#) with a [vrna\\_ep\\_t](#) input

The centroid is the structure with the minimal average distance to all other structures

$$\langle d(S) \rangle = \sum_{(i,j) \in S} (1 - p_{ij}) + \sum_{(i,j) \notin S} p_{ij}$$

Thus, the centroid is simply the structure containing all pairs with  $p_{ij} > 0.5$ . The distance of the centroid to the ensemble is written to the memory addressed by *dist*.

## Parameters

in	<i>length</i>	The length of the sequence
out	<i>dist</i>	A pointer to the distance variable where the centroid distance will be written to
in	<i>pl</i>	A pair list containing base pair probability information about the ensemble

## Returns

The centroid structure of the ensemble in dot-bracket notation

## 17.20.2.3 vrna\_centroid\_from\_probs()

```
char* vrna_centroid_from_probs (
    int length,
    double * dist,

#include <ViennaRNA/centroid.h>
```

Get the centroid structure of the ensemble.

This function is a threadsafe replacement for [centroid\(\)](#) with a probability array input

The centroid is the structure with the minimal average distance to all other structures

$$\langle d(S) \rangle = \sum_{(i,j) \in S} (1 - p_{ij}) + \sum_{(i,j) \notin S} p_{ij}$$

Thus, the centroid is simply the structure containing all pairs with  $p_{ij} > 0.5$ . The distance of the centroid to the ensemble is written to the memory addressed by *dist*.

## Parameters

in	<i>length</i>	The length of the sequence
out	<i>dist</i>	A pointer to the distance variable where the centroid distance will be written to
in	<i>probs</i>	An upper triangular matrix containing base pair probabilities (access via <a href="#">iindx_vrna_idx_row_wise()</a> )

**Returns**

The centroid structure of the ensemble in dot-bracket notation

### 17.21.1 Detailed Description

Predict structures formed by two molecules upon hybridization.

The function of an RNA molecule often depends on its interaction with other RNAs. The following routines therefore allows one to predict structures formed by two RNA molecules upon hybridization.

One approach to co-folding two RNAs consists of concatenating the two sequences and keeping track of the concatenation point in all energy evaluations. Correspondingly, many of the [cofold\(\)](#) and [co\\_pf\\_fold\(\)](#) routines below take one sequence string as argument and use the the global variable [cut\\_point](#) to mark the concatenation point. Note that while the *RNAcofold* program uses the '&' character to mark the chain break in its input, you should not use an '&' when using the library routines (set [cut\\_point](#) instead).

In a second approach to co-folding two RNAs, cofolding is seen as a stepwise process. In the first step the probability of an unpaired region is calculated and in a second step this probability of an unpaired region is multiplied with the probability of an interaction between the two RNAs. This approach is implemented for the interaction between a long target sequence and a short ligand RNA. Function [pf\\_unstru\(\)](#) calculates the partition function over all unpaired regions in the input sequence. Function [pf\\_interact\(\)](#), which calculates the partition function over all possible interactions between two sequences, needs both sequence as separate strings as input.

#### 17.23.1 Detailed Description

compute various properties (consensus MFE structures, partition function, Boltzmann distributed stochastic samples, ...) for RNA sequence alignments

Consensus structures can be predicted by a modified version of the [fold\(\)](#) algorithm that takes a set of aligned sequences instead of a single sequence. The energy function consists of the mean energy averaged over the sequences, plus a covariance term that favors pairs with consistent and compensatory mutations and penalizes pairs that cannot be formed by all structures. For details see [7] and [1].

## 17.23.2 Function Documentation

### 17.23.2.1 `energy_of_alistruct()`

```
float energy_of_alistruct (
    const char ** sequences,
    const char * structure,
    int n_seq,
    float * energy )
```

```
#include <ViennaRNA/alifold.h>
```

Calculate the free energy of a consensus structure given a set of aligned sequences.

**Deprecated** Usage of this function is discouraged! Use `vrna_eval_structure()`, and `vrna_eval_covar_structure()` instead!

#### Parameters

<i>sequences</i>	The NULL terminated array of sequences
<i>structure</i>	The consensus structure
<i>n_seq</i>	The number of sequences in the alignment
<i>energy</i>	A pointer to an array of at least two floats that will hold the free energies (energy[0] will contain the free energy, energy[1] will be filled with the covariance energy term)

#### Returns

free energy in kcal/mol

### 17.23.2.2 `get_alipf_arrays()`

```
int get_alipf_arrays (
    short *** S_p,
    short *** S5_p,
    short *** S3_p,
    unsigned short *** a2s_p,
    char *** Ss_p,

    FLT_OR_DBL ** qm_p,
    FLT_OR_DBL ** qlk_p,
    FLT_OR_DBL ** qln_p,
    short ** pscore )
```

```
#include <ViennaRNA/alifold.h>
```

Get pointers to (almost) all relevant arrays used in alifold's partition function computation.

**Note**

To obtain meaningful pointers, call `alipf_fold` first!

**See also**

`pf_alifold()`, [alipf\\_circ\\_fold\(\)](#)

**Deprecated** It is discouraged to use this function! The new [vrna\\_fold\\_compound\\_t](#) allows direct access to all necessary consensus structure prediction related variables!

**See also**

[vrna\\_fold\\_compound\\_t](#), [vrna\\_fold\\_compound\\_comparative\(\)](#), [vrna\\_pf\(\)](#)

**Parameters**

<i>S_p</i>	A pointer to the 'S' array (integer representation of nucleotides)
<i>S5_p</i>	A pointer to the 'S5' array
<i>S3_p</i>	A pointer to the 'S3' array
<i>a2s↔ _p</i>	A pointer to the alignment-column to sequence position mapping array
<i>Ss_p</i>	A pointer to the 'Ss' array
<i>qb_p</i>	A pointer to the $Q^B$ matrix
<i>qm_p</i>	A pointer to the $Q^M$ matrix
<i>q1k↔ _p</i>	A pointer to the 5' slice of the Q matrix ( $q1k(k) = Q(1, k)$ )
<i>qln_p</i>	A pointer to the 3' slice of the Q matrix ( $qln(l) = Q(l, n)$ )
<i>pscore</i>	A pointer to the start of a pscore list

**Returns**

Non Zero if everything went fine, 0 otherwise

**17.23.2.3 update\_alifold\_params()**

```
void update_alifold_params (
    void )
```

```
#include <ViennaRNA/alifold.h>
```

Update the energy parameters for alifold function.

Call this to recalculate the pair matrix and energy parameters after a change in folding parameters like [temperature](#)

**Deprecated** Usage of this function is discouraged! The new API uses [vrna\\_fold\\_compound\\_t](#) to lump all folding related necessities together, including the energy parameters. Use `vrna_update_fold_params()` to update the energy parameters within a [vrna\\_fold\\_compound\\_t](#).

### 17.23.3 Variable Documentation

#### 17.23.3.1 `cv_fact`

```
double cv_fact
```

```
#include <ViennaRNA/alifold.h>
```

This variable controls the weight of the covariance term in the energy function of alignment folding algorithms.

**Deprecated** See [vrna\\_md\\_t.cv\\_fact](#), and [vrna\\_mfe\(\)](#) to avoid using global variables

Default is 1.

#### 17.23.3.2 `nc_fact`

```
double nc_fact
```

```
#include <ViennaRNA/alifold.h>
```

This variable controls the magnitude of the penalty for non-compatible sequences in the covariance term of alignment folding algorithms.

**Deprecated** See [vrna\\_md\\_t.nc\\_fact](#), and [vrna\\_mfe\(\)](#) to avoid using global variables

Default is 1.

### 17.24.1 Detailed Description

### 17.24.2 Function Documentation

#### 17.24.2.1 vrna\_alifold()

```
float vrna_alifold (
    const char ** sequences,
    char * structure )
```

```
#include <ViennaRNA/alifold.h>
```

Compute Minimum Free Energy (MFE), and a corresponding consensus secondary structure for an RNA sequence alignment using a comparative method.

This simplified interface to [vrna\\_mfe\(\)](#) computes the MFE and, if required, a consensus secondary structure for an RNA sequence alignment using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing, e.g. suboptimal backtracking, etc.

#### Note

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_mfe\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

## Returns

the minimum free energy (MFE) in kcal/mol

17.24.2.2 `vrna_circalifold()`

```
float vrna_circalifold (
    const char ** sequences,
    char * structure )
```

```
#include <ViennaRNA/alifold.h>
```

Compute Minimum Free Energy (MFE), and a corresponding consensus secondary structure for a sequence alignment of circular RNAs using a comparative method.

This simplified interface to [vrna\\_mfe\(\)](#) computes the MFE and, if required, a consensus secondary structure for an RNA sequence alignment using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing, e.g. suboptimal backtracking, etc.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [\[9\]](#) for further details.

## Note

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_mfe\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

## Returns

the minimum free energy (MFE) in kcal/mol

### 17.24.2.3 alifold()

```
float alifold (
    const char ** strings,
    char * structure )

#include <ViennaRNA/alifold.h>
```

Compute MFE and according consensus structure of an alignment of sequences.

This function predicts the consensus structure for the aligned 'sequences' and returns the minimum free energy; the mfe structure in bracket notation is returned in 'structure'.

Sufficient space must be allocated for 'structure' before calling [alifold\(\)](#).

**Deprecated** Usage of this function is discouraged! Use [vrna\\_alifold\(\)](#), or [vrna\\_mfe\(\)](#) instead!

See also

[vrna\\_alifold\(\)](#), [vrna\\_mfe\(\)](#)

#### Parameters

<i>strings</i>	A pointer to a NULL terminated array of character arrays
<i>structure</i>	A pointer to a character array that may contain a constraining consensus structure (will be overwritten by a consensus structure that exhibits the MFE)

#### Returns

The free energy score in kcal/mol

### 17.24.2.4 circalifold()

```
float circalifold (
    const char ** strings,
    char * structure )

#include <ViennaRNA/alifold.h>
```

Compute MFE and according structure of an alignment of sequences assuming the sequences are circular instead of linear.

**Deprecated** Usage of this function is discouraged! Use [vrna\\_alicircfold\(\)](#), and [vrna\\_mfe\(\)](#) instead!

See also

[vrna\\_alicircfold\(\)](#), [vrna\\_alifold\(\)](#), [vrna\\_mfe\(\)](#)

## Parameters

<i>strings</i>	A pointer to a NULL terminated array of character arrays

## 17.24.2.5 free\_alifold\_arrays()

```
void free_alifold_arrays (
    void )
```

```
#include <ViennaRNA/alifold.h>
```

Free the memory occupied by MFE alifold functions.

**Deprecated** Usage of this function is discouraged! It only affects memory being free'd that was allocated by an old API function before. Release of memory occupied by the newly introduced [vrna\\_fold\\_compound\\_t](#) is handled by [vrna\\_vrna\\_fold\\_compound\\_free\(\)](#)

[vrna\\_pf\\_circalifold\(\)](#), [vrna\\_pf\(\)](#), [vrna\\_fold\\_compound\\_comparative\(\)](#), [vrna\\_fold\\_compound\\_t](#)

## Parameters

<i>sequences</i>	RNA sequence alignment
<i>structure</i>	A pointer to the character array where position-wise pairing propensity will be stored. (Maybe NULL)
<i>pl</i>	A pointer to a list of <a href="#">vrna_ep_t</a> to store pairing probabilities (Maybe NULL)

## Returns

The Gibbs free energy of the ensemble ( $G = -RT \cdot \log(Q)$ ) in kcal/mol

17.25.2.2 [vrna\\_pf\\_circalifold\(\)](#)

```
float vrna_pf_circalifold (
    const char ** sequences,
    char * structure,
    vrna_ep_t ** pl )
```

```
#include <ViennaRNA/alifold.h>
```

Compute Partition function  $Q$  (and base pair probabilities) for an alignment of circular RNA sequences using a comparative method.

This simplified interface to [vrna\\_pf\(\)](#) computes the partition function and, if required, base pair probabilities for an RNA sequence alignment using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing.

## Note

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_pf\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [\[9\]](#) for further details.

## Parameters

<i>sequences</i>	Sequence alignment of circular RNAs
<i>structure</i>	A pointer to the character array where position-wise pairing propensity will be stored. (Maybe NULL)
<i>pl</i>	A pointer to a list of <a href="#">vrna_ep_t</a> to store pairing probabilities (Maybe NULL)

**Returns**

The Gibbs free energy of the ensemble (  $G = -RT \cdot \log(Q)$ ) in kcal/mol

**17.25.2.3 alipf\_fold\_par()**

```
float alipf_fold_par (
    const char ** sequences,
    char * structure,
    vrna_ep_t ** pl,
    vrna_exp_param_t * parameters,
    int calculate_bppm,
    int is_constrained,
    int is_circular )
```

```
#include <ViennaRNA/alifold.h>
```

**Deprecated** Use `vrna_pf()` instead

**Parameters**

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	
<i>parameters</i>	
<i>calculate_bppm</i>	
<i>is_constrained</i>	
<i>is_circular</i>	

**Returns****17.25.2.4 alipf\_fold()**

```
float alipf_fold (
    const char ** sequences,
    char * structure,
    vrna_ep_t ** pl )
```

```
#include <ViennaRNA/alifold.h>
```

The partition function version of `alifold()` works in analogy to `pf_fold()`. Pair probabilities and information about sequence covariations are returned via the 'pi' variable as a list of `vrna_pinfo_t` structs. The list is terminated by the first entry with `pi.i = 0`.

**Deprecated** Use `vrna_pf()` instead

## Parameters

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	

## Returns

17.25.2.5 `alipf_circ_fold()`

```
float alipf_circ_fold (
    const char ** sequences,
    char * structure,
    vrna_ep_t ** pl )

#include <ViennaRNA/alifold.h>
```

**Deprecated** Use `vrna_pf()` instead

## Parameters

<i>sequences</i>	
<i>structure</i>	
<i>pl</i>	

## Returns

17.25.2.6 `export_ali_bppm()`

```
FLT_OR_DBL* export_ali_bppm (
    void )

#include <ViennaRNA/alifold.h>
```

Get a pointer to the base pair probability array.

Accessing the base pair probabilities for a pair (i,j) is achieved by

```
FLT_OR_DBL *pr = export_bppm(); pr_ij = pr[iindx[i]-j];
```

**Deprecated** Usage of this function is discouraged! The new `vrna_fold_compound_t` allows direct access to the folding matrices, including the pair probabilities! The pair probability array returned here reflects the one of the latest call to `vrna_pf()`, or any of the old API calls for consensus structure partition function folding.

See also

#### 17.25.2.7 free\_alipf\_arrays()

```
void free_alipf_arrays (  
    void )
```

```
#include <ViennaRNA/alifold.h>
```

Free the memory occupied by folding matrices allocated by `alipf_fold`, `alipf_circ_fold`, etc.

**Deprecated** Usage of this function is discouraged! This function only free's memory allocated by old API function calls. Memory allocated by any of the new API calls (starting with `vrna_`) will be not affected!

Compute Thermodynamic properties for a Distance Class Partitioning of the Secondary Structure Space.

All functions related to this group implement the basic recursions for MFE folding, partition function computation and stochastic backtracking with a *classified dynamic programming* approach. The secondary structure space is divided into partitions according to the base pair distance to two given reference structures and all relevant properties are calculated for each of the resulting partitions

    int distance1,
    int distance2 )
```

```
#include <ViennaRNA/2Dfold.h>
```

Compute MFE's and representative for distance partitioning.

This function computes the minimum free energies and a representative secondary structure for each distance class according to the two references specified in the datastructure 'vars'. The maximum basepair distance to each of both references may be set by the arguments 'distance1' and 'distance2', respectively. If both distance arguments are set to '-1', no restriction is assumed and the calculation is performed for each distance class possible.

The returned list contains an entry for each distance class. If a maximum basepair distance to either of the references was passed, an entry with  $k=-1$  will be appended in the list, denoting the class where all structures exceeding the maximum will be thrown into. The end of the list is denoted by an attribute value of [INF](#) in the  $k$ -attribute of the list entry.

## Parameters

<i>vc</i>	The datastructure containing all precomputed folding attributes
<i>distance1</i>	maximum distance to reference1 (-1 means no restriction)
<i>distance2</i>	maximum distance to reference2 (-1 means no restriction)

**Returns**

A list of minimum free energies (and corresponding structures) for each distance class

#include <ViennaRNA/2Dfold.h>
```

Backtrack a minimum free energy structure from a 5' section of specified length.

This function allows one to backtrack a secondary structure beginning at the 5' end, a specified length and residing in a specific distance class. If the argument 'k' gets a value of -1, the structure that is backtracked is assumed to reside in the distance class where all structures exceeding the maximum basepair distance specified in [vrna\\_mfe\\_TwoD\(\)](#) belong to.

**Note**

```
#include <ViennaRNA/2Dfold.h>
```

Get a structure of type `TwoDfold_vars` prefilled with current global settings.

This function returns a datastructure of type `TwoDfold_vars`. The data fields inside the `TwoDfold_vars` are prefilled by global settings and all memory allocations necessary to start a computation are already done for the convenience of the user

#### Note

**Deprecated** Use the new API that relies on `vrna_fold_compound_t` and the corresponding functions `vrna_fold_compound_TwoD()`, `vrna_mfe_TwoD()`, and `vrna_fold_compound_free()` instead!

#### Parameters

<i>seq</i>	The RNA sequence
<i>structure1</i>	The first reference structure in dot-bracket notation
<i>structure2</i>	The second reference structure in dot-bracket notation
<i>circ</i>	A switch to indicate the assumption to fold a circular instead of linear RNA (0=OFF, 1=ON)

#### Returns

A datastructure prefilled with folding options and allocated memory

#### 17.29.4.4 `destroy_TwoDfold_variables()`

```
void destroy_TwoDfold_variables (
    TwoDfold_vars * our_variables )
```

#include <ViennaRNA/2Dpfold.h>
```

Compute the partition function for all distance classes.

This function computes the partition functions for all distance classes according to the two reference structures specified in the datastructure 'vars'. Similar to `vrna_mfe_TwoD()` the arguments `maxDistance1` and `maxDistance2` specify the maximum distance to both reference structures. A value of '-1' in either of them makes the appropriate distance restrictionless, i.e. all basepair distances to the reference are taken into account during computation. In case there is a restriction, the returned solution contains an entry where the attribute `k=l=-1` contains the partition function for all structures exceeding the restriction. A value of `INF` in the attribute 'k' of the returned list denotes the end of the list.

```

```
#include <ViennaRNA/2Dpfold.h>
```

Sample secondary structure representatives with a specified length from a set of distance classes according to their Boltzmann probability.

This function does essentially the same as [vrna\\_pbacktrack\\_TwoD\(\)](#) with the only difference that partial structures, i.e. structures beginning from the 5' end with a specified length of the sequence, are backtracked

**Note**

This function does not work (since it makes no sense) for circular RNA sequences!

**Precondition**

The argument 'vars' must contain precalculated partition function matrices, i.e. a call to [vrna\\_pf\\_TwoD\(\)](#) preceding this function is mandatory!

**See also**

**Parameters**

in, out	vc	The <a href="#">vrna_fold_compound_t</a> datastructure containing all necessary folding attributes and matrices
in	d1	The distance to reference1 (may be -1)
in	d2	The distance to reference2
in	length	The length of the structure beginning from the 5' end

**Returns**

A sampled secondary structure in dot-bracket notation

Find sequences with predefined structure.

This function searches for a sequence with minimum free energy structure provided in the parameter 'target', starting with sequence 'start'. It returns 0 if the search was successful, otherwise a structure distance in terms of the energy difference between the search result and the actual target 'target' is returned. The found sequence is returned in 'start'. If [give\\_up](#) is set to 1, the function will return as soon as it is clear that the search will be unsuccessful, this speeds up the algorithm if you are only interested in exact solutions.

**Parameters**

<i>start</i>	The start sequence

It returns  $-kT \cdot \log(p)$  where  $p$  is the frequency of 'target' in the ensemble of possible structures. This is usually much slower than [inverse\\_fold\(\)](#).

### 17.34.1 Detailed Description

Different functions to generate structural neighbors of a secondary structure according to a particular Move Set.

This module contains methods to compute the neighbors of an RNA secondary structure. Neighbors of a given structure are all structures that differ in exactly one base pair. That means one can insert or delete base pairs in the given structure. These insertions and deletions of base pairs are usually called moves. A third move which is considered in these methods is a shift move. A shifted base pair has one stable position and one position that changes. These moves are encoded as follows:

- insertion:  $(i, j)$  where  $i, j > 0$
  - deletion:  $(i, j)$  where  $i, j < 0$
  - shift:  $(i, j)$  where either  $i > 0, j < 0$  or  $i < 0, j > 0$
- The negative position of a shift indicates the position that has changed.

Example:

```
We have given a sequence and a structure.
Sequence  AAGGAAACC
Structure ..(.....)
Indices   123456789
```

```
The given base pair is (3,9) and the neighbors are the insertion (4, 8), the deletion (-3,-9), the
shift (3,-8)
and the shift (-4, 9).
This leads to the neighbored structures:
... (....)
.....
... (....)
.... (....)
```

A simple method to construct all insertions is to iterate over the positions of a sequence twice. The first iteration has the index  $i$  in  $[1, \text{sequence length}]$ , the second iteration has the index  $j$  in  $[i+1, \text{sequence length}]$ . All pairs  $(i, j)$  with compatible letters and which are non-crossing with present base pairs are valid neighbored insertion moves. Valid deletion moves are all present base pairs with negative sign. Valid shift moves are constructed by taking all paired positions as fix position of a shift move and iterating over all positions of the sequence. If the letters of a position are compatible and if it the move is non-crossing with existing base pairs, we have a valid shift move. The method of generating shift moves can be accelerated by skipping neighbored base pairs.

If we need to construct all neighbors several times for subsequent moves, we can speed up the task by using the move set of the previous structure. The previous move set has to be filtered, such that all moves that would cross the next selected move are non-crossing. Next, the selected move has to be removed. Then one has to only to generate all moves that were not possible before. One move is the inverted selected move (if it was an insertion, simply make the indices negative). The generation of all other new moves is different and depends on the selected move. It is easy for an insertion move, because we have only to include all non-crossing shift moves, that are possible with the new base pair. For that we can either iterate over the sequence or we can select all crossing shift moves in the filter procedure and convert them into shifts.

The generation of new moves given a deletion is a little bit more complex, because we can create more moves. At first we can insert the deleted pair as insertion move. Then we generate all insertions that would have crossed the deleted base pair. Finally we construct all crossing shift moves.

If the given move is a shift, we can save much time by specifying the intervals for the generation of new moves. The interval which was enclosed by the positive position of the shift move and the previous paired position is the freed interval after applying the move. This freed interval includes all positions and base pairs that we need to construct new insertions and shifts. All these new moves have one position in the freed interval and the other position in the environment of the freed interval. The environment are all position which are outside the freed interval, but within the same enclosing loop of the shift move. The environment for valid base pairs can be divided into one or more intervals, depending on the shift move. The following examples describe a few scenarios to specify the intervals of the environment.

Given the intervals of the environment and the freed interval, the new shift moves can be constructed quickly. One has to take all positions of pairs from the environment in order to create valid pairs with positions in the freed interval. The same procedure can be applied for the other direction. This is taking all paired positions within the freed interval in order to look for pairs with valid positions in the intervals of the environment.

## 17.34.2 Data Structure Documentation

### 17.34.2.1 struct vrna\_move\_s

An atomic representation of the transition / move from one structure to its neighbor.

An atomic transition / move may be (a) the insertion of a base pair (both fields are positive), (b) the deletion of a base pair (both fields are negative), or (c) a base pair shift where one position stays constant while the other is allowed to shift along the same loop it resides in (one field position and the other negative, where the positive field indicates the constant position and the absolute value of the negative field is the new position of the pairing partner).

A value of 0 in either field is typically used to indicate the list's last element.

## 17.34.4 Function Documentation

### 17.34.4.1 vrna\_move\_list\_free()

```
void vrna_move_list_free (
    vrna_move_t * moves )
#include <ViennaRNA/neighbor.h>
```

delete all moves in a zero terminated list.

### 17.34.4.2 vrna\_move\_apply()

```
void vrna_move_apply (
    short * pt,
    const vrna_move_t * m )
#include <ViennaRNA/neighbor.h>
```

Apply a particular move / transition to a secondary structure, i.e. transform a structure.

## Parameters

in, out	<i>pt</i>	The pair table representation of the secondary structure
in	<i>m</i>	The move to apply

17.34.4.3 `vrna_loopidx_update()`

```
void vrna_loopidx_update (
    int * loopidx,
    const short * pt,
    int length,
    const vrna_move_t * m )
```

```
#include <ViennaRNA/neighbor.h>
```

Alters the loopIndices array that was constructed with `vrna_loopidx_from_ptable()`.

The loopIndex of the current move will be inserted. The correctness of the input will not be checked because the speed should be optimized.

## Parameters

in, out	<i>loopidx</i>	The loop index data structure that needs an update
in	<i>pt</i>	A pair table on which the move will be executed
	<i>length</i>	The length of the structure
in	<i>m</i>	The move that is applied to the current structure

17.34.4.4 `vrna_neighbors()`

```
vrna_move_t* vrna_neighbors (
    vrna_fold_compound_t * vc,
    const short * pt,
    unsigned int options )
```

```
#include <ViennaRNA/neighbor.h>
```

Generate neighbors of a secondary structure.

This function allows one to generate all structural neighbors (according to a particular move set) of an RNA secondary structure. The neighborhood is then returned as a list of transitions / moves required to transform the current structure into the actual neighbor.

## Parameters

in	<i>vc</i>	A <code>vrna_fold_compound_t</code> containing the energy parameters and model details
in	<i>pt</i>	The pair table representation of the structure
	<i>options</i>	Options to modify the behavior of this function, e.g. available move set

## Returns

Neighbors as a list of moves / transitions (the last element in the list has both of its fields set to 0)

17.34.4.5 `vrna_neighbors_successive()`

```
vrna_move_t* vrna_neighbors_successive (
    const vrna_fold_compound_t * vc,
    const vrna_move_t * curr_move,
    const short * prev_pt,
    const vrna_move_t * prev_neighbors,
    int size_prev_neighbors,
    int * size_neighbors,
    unsigned int options )
```

```
#include <ViennaRNA/neighbor.h>
```

Generate neighbors of a secondary structure (the fast way)

This function implements a fast way to generate all neighbors of a secondary structure that results from successive applications of individual moves. The speed-up results from updating an already known list of valid neighbors before the individual move towards the current structure took place. In essence, this function removes neighbors that are not accessible anymore and inserts neighbors emerging after a move took place.

### 17.37.2 Function Documentation

17.37.2.1 `vrna_sc_add_SHAPE_deigan()`

```
int vrna_sc_add_SHAPE_deigan (
    vrna_fold_compound_t * vc,
    const double * reactivities,
    double m,
    double b,
    unsigned int options )

#include <ViennaRNA/constraints_SHAPE.h>
```

Add SHAPE reactivity data as soft constraints (Deigan et al. method)

This approach of SHAPE directed RNA folding uses the simple linear ansatz

$$\Delta G_{\text{SHAPE}}(i) = m \ln(\text{SHAPE reactivity}(i) + 1) + b$$

to convert SHAPE reactivity values to pseudo energies whenever a nucleotide  $i$  contributes to a stacked pair. A positive slope  $m$  penalizes high reactivities in paired regions, while a negative intercept  $b$  results in a confirmatory "bonus" free energy for correctly predicted base pairs. Since the energy evaluation of a base pair stack involves two pairs, the pseudo energies are added for all four contributing nucleotides. Consequently, the energy term is applied twice for pairs inside a helix and only once for pairs adjacent to other structures. For all other loop types the energy model remains unchanged even when the experimental data highly disagrees with a certain motif.

    const char * shape_conversion,
    unsigned int options )
```

```
#include <ViennaRNA/constraints_SHAPE.h>
```

Add SHAPE reactivity data as soft constraints (Zarringhalam et al. method)

This method first converts the observed SHAPE reactivity of nucleotide  $i$  into a probability  $q_i$  that position  $i$  is unpaired by means of a non-linear map. Then pseudo-energies of the form

$$\Delta G_{\text{SHAPE}}(x, i) = \beta |x_i - q_i|$$

are computed, where  $x_i = 0$  if position  $i$  is unpaired and  $x_i = 1$  if  $i$  is paired in a given secondary structure. The parameter  $\beta$  serves as scaling factor. The magnitude of discrepancy between prediction and experimental observation is represented by  $|x_i - q_i|$ .

    double * epsilon,
    double initialStepSize,
    double minStepSize,
    double minImprovement,
    double minimizerTolerance,
    progress_callback callback )
```

```
#include <ViennaRNA/perturbation_fold.h>
```

Find a vector of perturbation energies that minimizes the discrepancies between predicted and observed pairing probabilities and the amount of necessary adjustments.

Use an iterative minimization algorithm to find a vector of perturbation energies whose incorporation as soft constraints shifts the predicted pairing probabilities closer to the experimentally observed probabilities. The algorithm aims to minimize an objective function that penalizes discrepancies between predicted and observed pairing probabilities and energy model adjustments, i.e. an appropriate vector of perturbation energies satisfies

$$F(\vec{\epsilon}) = \sum_{\mu} \frac{\epsilon_{\mu}^2}{\tau^2} + \sum_{i=1}^n \frac{(p_i(\vec{\epsilon}) - q_i)^2}{\sigma^2} \rightarrow \min.$$

An initialized fold compound and an array containing the observed probability for each nucleotide to be unbound are required as input data. The parameters `objective_function`, `sigma_squared` and `tau_squared` are responsible for adjusting the aim of the objective function. Dependend on which type of objective function is selected, either squared or absolute aberrations are contributing to the objective function. The ratio of the parameters `sigma_squared` and `tau_squared` can be used to adjust the algorithm to find a solution either close to the thermodynamic prediction (`sigma_squared >> tau_squared`) or close to the experimental data (`tau_squared >> sigma_squared`). The minimization can be performed by makeing use of a custom gradient descent implementation or using one of the minimizing algorithms provided by the GNU Scientific Library. All algorithms require the evaluation of the gradient of the objective function, which includes the evaluation of conditional pairing probabilities. Since an exact evaluation is expensive, the probabilities can also be estimated from sampling by setting an appropriate sample size. The found vector of perturbation energies will be stored in the array `epsilon`. The progress of the minimization process can be tracked by implementing and passing a callback function.

#### Parameters

<code>vc</code>	Pointer to a fold compound
-----------------	----------------------------

## Parameters

<i>q_prob_unpaired</i>	Pointer to an array containing the probability to be unpaired for each nucleotide
<i>objective_function</i>	The type of objective function to be used (VRNA_OBJECTIVE_FUNCTION_QUADRATIC / VRNA_OBJECTIVE_FUNCTION_LINEAR)
<i>sigma_squared</i>	A factor used for weighting the objective function. More weight on this factor will lead to a solution close to the null vector.
<i>tau_squared</i>	A factor used for weighting the objective function. More weight on this factor will lead to a solution close to the data provided in <i>q_prob_unpaired</i> .
<i>algorithm</i>	The minimization algorithm (VRNA_MINIMIZER_*)
<i>sample_size</i>	The number of sampled sequences used for estimating the pairing probabilities. A value $\leq 0$ will lead to an exact evaluation.
<i>epsilon</i>	A pointer to an array used for storing the calculated vector of perturbation energies
<i>callback</i>	A pointer to a callback function used for reporting the current minimization progress

## 17.40 Ligands binding to unstructured domains

Add ligand binding to loop regions using the [Unstructured domains](#) feature.

Collaboration diagram for Ligands binding to unstructured domains:

Add ligand binding to loop regions using the [Unstructured domains](#) feature.

Sometime, certain ligands, like single strand binding (SSB) proteins, compete with intramolecular base pairing of the RNA. In situations, where the dissociation constant of the ligand is known and the ligand binds to a consecutive stretch of single-stranded nucleotides we can use the [Unstructured domains](#) functionality to extend the RNA folding grammar. This module provides a convenience default implementation that covers most of the application scenarios.

The function `vrna_ud_add_motif()` attaches a ligands sequence motif and corresponding binding free energy to the list of known ligand motifs within a `vrna_fold_compound_t.domains_up` attribute. The first call to this function initializes the [Unstructured domains](#) feature with our default implementation. Subsequent calls of secondary structure prediction algorithms with the modified `vrna_fold_compound_t` then directly include the competition of the ligand with regules base pairing. Since we utilize the unstructured domain extension, The ligand binding model can be removed again using the `vrna_ud_remove()` function.

## 17.44.4 Function Documentation

#### 17.44.4.1 vrna\_C11\_features()

```
void vrna_C11_features (
    void )
```

```
#include <ViennaRNA/data_structures.h>
```

Dummy symbol to check whether the library was build using C11/C++11 features.

By default, several data structures of our new v3.0 API use C11/C++11 features, such as unnamed unions, unnamed structs. However, these features can be deactivated at compile time to allow building the library and executables with compilers that do not support these features.

Now, the problem arises that once our static library is compiled and a third-party application is supposed to link against it, it needs to know, at compile time, how to correctly address particular data structures. This is usually implicitly taken care of through the API exposed in our header files. Unfortunately, we had some preprocessor directives in our header files that changed the API depending on the capabilities of the compiler the third-party application is build with. This in turn prohibited the use of an RNALib compiled without C11/C++11 support in a program that compiles/links with enabled C11/C++11 support and vice-versa.

Therefore, we introduce this dummy symbol which can be used to check, whether the static library was build with C11/C++11 features.

#### Note

If the symbol is present, the library was build with enabled C11/C++11 features support and no action is required. However, if the symbol is missing in RNALib  $\geq 2.2.9$ , programs that link to RNALib must define a pre-processor identifier `VRNA_DISABLE_C11_FEATURES` before including any ViennaRNA Package header file, for instance by adding a `CPPFLAG`

```
CPPFLAGS+=-DVRNA_DISABLE_C11_FEATURES
```

### 17.45.1 Detailed Description

### 17.45.2 Macro Definition Documentation

#### 17.45.2.1 VRNA\_INPUT\_FASTA\_HEADER

```
#define VRNA_INPUT_FASTA_HEADER 8U

#include <ViennaRNA/utils.h>
```

Input/Output flag of `get_input_line()`:

if used as input option this tells `get_input_line()` that the data to be read should comply with the FASTA format.

the function will return this flag if a fasta header was read

#### 17.45.2.2 VRNA\_INPUT\_CONSTRAINT

```
#define VRNA_INPUT_CONSTRAINT 32U

#include <ViennaRNA/utils.h>
```

Input flag for `get_input_line()`:

Tell `get_input_line()` that we assume to read a structure constraint.

### 17.45.3 Function Documentation

#### 17.45.3.1 `vrna_ptypes()`

```
char* vrna_ptypes (
    const short * S,
    vrna_md_t * md )
```

```
#include <ViennaRNA/alphabet.h>
```

Get an array of the numerical encoding for each possible base pair (i,j)

##### Note

This array is always indexed in column-wise order, in contrast to previously different indexing between mfe and pf variants!

##### See also

[vrna\\_idx\\_col\\_wise\(\)](#), [vrna\\_fold\\_compound\\_t](#)

#### 17.45.3.2 `vrna_nucleotide_encode()`

```
int vrna_nucleotide_encode (
    char c,
    vrna_md_t * md )
```

```
#include <ViennaRNA/alphabet.h>
```

Encode a nucleotide character to numerical value.

This function encodes a nucleotide character to its numerical representation as required by many functions in R<sub>NALib</sub>.

##### See also

[vrna\\_nucleotide\\_decode\(\)](#), [vrna\\_seq\\_encode\(\)](#)

##### Parameters

<i>c</i>	The nucleotide character to encode
<i>md</i>	The model details that determine the kind of encoding

**Returns**

The encoded nucleotide

**17.45.3.3 vrna\_nucleotide\_decode()**

```
char vrna_nucleotide_decode (
    int enc,
    vrna_md_t * md )
```

```
#include <ViennaRNA/alphabet.h>
```

Decode a numerical representation of a nucleotide back into nucleotide alphabet.

This function decodes a numerical representation of a nucleotide character back into nucleotide alphabet

**See also**

[vrna\\_nucleotide\\_encode\(\)](#), [vrna\\_seq\\_encode\(\)](#)

**Parameters**

<i>enc</i>	The encoded nucleotide
<i>md</i>	The model details that determine the kind of decoding

**Returns**

The decoded nucleotide character

**17.45.3.4 vrna\_enumerate\_necklaces()**

```
unsigned int ** vrna_enumerate_necklaces (
    const unsigned int * type_counts )
```

```
#include <ViennaRNA/combinatorics.h>
```

Enumerate all necklaces with fixed content.

This function implements *A fast algorithm to generate necklaces with fixed content* as published by Joe Sawada in 2003 [16].

The function receives a list of counts (the elements on the necklace) for each type of object within a necklace. The list starts at index 0 and ends with an entry that has a count of 0. The algorithm then enumerates all non-cyclic permutations of the content, returned as a list of necklaces. This list, again, is zero-terminated, i.e. the last entry of the list is a NULL pointer.

**Parameters**

<code>type_counts</code>	A 0-terminated list of entity counts
--------------------------	--------------------------------------

**Returns**

A list of all non-cyclic permutations of the entities

**SWIG Wrapper Notes** This function is available as global function **enumerate\_necklaces()** which accepts lists input, and produces list of lists output.

**17.45.3.5 vrna\_alloc()**

```
void* vrna_alloc (
    unsigned size )
```

```
#include <ViennaRNA/utils.h>
```

Allocate space safely.

**Parameters**

<code>size</code>	The size of the memory to be allocated in bytes
-------------------	---

**Returns**

A pointer to the allocated memory

**17.45.3.6 vrna\_realloc()**

```
void* vrna_realloc (
    void * p,
    unsigned size )
```

```
#include <ViennaRNA/utils.h>
```

Reallocate space safely.

**Parameters**

<code>p</code>	A pointer to the memory region to be reallocated
<code>size</code>	The size of the memory to be allocated in bytes

### Returns

A pointer to the newly allocated memory

#### 17.45.3.7 `vrna_message_error()`

```
void vrna_message_error (
    const char * format,
    ... )
```

```
#include <ViennaRNA/utils.h>
```

Print an error message and die.

This function is a wrapper to `fprintf(stderr, ...)` that puts a capital **ERROR:** in front of the message and then exits the calling program.

### See also

[vrna\\_message\\_verror\(\)](#), [vrna\\_message\\_warning\(\)](#), [vrna\\_message\\_info\(\)](#)

### Parameters

<i>format</i>	The error message to be printed
...	Optional arguments for the formatted message string

#### 17.45.3.8 `vrna_message_verror()`

```
void vrna_message_verror (
    const char * format,
    va_list args )
```

```
#include <ViennaRNA/utils.h>
```

Print an error message and die.

This function is a wrapper to `vfprintf(stderr, ...)` that puts a capital **ERROR:** in front of the message and then exits the calling program.

### See also

[vrna\\_message\\_error\(\)](#), [vrna\\_message\\_warning\(\)](#), [vrna\\_message\\_info\(\)](#)

### Parameters

<i>format</i>	The error message to be printed
<i>args</i>	The argument list for the formatted message string

### 17.45.3.9 vrna\_message\_warning()

```
void vrna_message_warning (
    const char * format,
    ... )
```

```
#include <ViennaRNA/utils.h>
```

Print a warning message.

This function is a wrapper to `fprintf(stderr, ...)` that puts a capital **WARNING:** in front of the message.

See also

[vrna\\_message\\_vwarning\(\)](#), [vrna\\_message\\_error\(\)](#), [vrna\\_message\\_info\(\)](#)

#### Parameters

<i>format</i>	The warning message to be printed
...	Optional arguments for the formatted message string

### 17.45.3.10 vrna\_message\_vwarning()

```
void vrna_message_vwarning (
    const char * format,
    va_list args )
```

```
#include <ViennaRNA/utils.h>
```

Print a warning message.

This function is a wrapper to `fprintf(stderr, ...)` that puts a capital **WARNING:** in front of the message.

See also

[vrna\\_message\\_vwarning\(\)](#), [vrna\\_message\\_error\(\)](#), [vrna\\_message\\_info\(\)](#)

#### Parameters

<i>format</i>	The warning message to be printed
<i>args</i>	The argument list for the formatted message string

17.45.3.11 `vrna_message_info()`

```
void vrna_message_info (
    FILE * fp,
    const char * format,
    ... )
```

```
#include <ViennaRNA/utils.h>
```

Print an info message.

This function is a wrapper to `fprintf(...)`.

See also

[vrna\\_message\\_vinfo\(\)](#), [vrna\\_message\\_error\(\)](#), [vrna\\_message\\_warning\(\)](#)

## Parameters

<i>fp</i>	The file pointer where the message is printed to
<i>format</i>	The warning message to be printed
...	Optional arguments for the formatted message string

17.45.3.12 `vrna_message_vinfo()`

```
void vrna_message_vinfo (
    FILE * fp,
    const char * format,
    va_list args )
```

```
#include <ViennaRNA/utils.h>
```

Print an info message.

This function is a wrapper to `fprintf(...)`.

See also

[vrna\\_message\\_vinfo\(\)](#), [vrna\\_message\\_error\(\)](#), [vrna\\_message\\_warning\(\)](#)

## Parameters

<i>fp</i>	The file pointer where the message is printed to
<i>format</i>	The info message to be printed
<i>args</i>	The argument list for the formatted message string

### 17.45.3.13 vrna\_urn()

```
double vrna_urn (  
    void )
```

```
#include <ViennaRNA/utils.h>
```

get a random number from [0..1]

#### See also

[vrna\\_int\\_urn\(\)](#), [vrna\\_init\\_rand\(\)](#)

#### Note

Usually implemented by calling *erand48()*.

#### Returns

A random number in range [0..1]

### 17.45.3.14 vrna\_int\_urn()

```
int vrna_int_urn (  
    int from,  
    int to )
```

```
#include <ViennaRNA/utils.h>
```

Generates a pseudo random integer in a specified range.

#### See also

[vrna\\_urn\(\)](#), [vrna\\_init\\_rand\(\)](#)

#### Parameters

<i>from</i>	The first number in range
<i>to</i>	The last number in range

#### Returns

A pseudo random number in range [from, to]

### 17.45.3.15 vrna\_time\_stamp()

```
char* vrna_time_stamp (
    void )
```

```
#include <ViennaRNA/utils.h>
```

Get a timestamp.

Returns a string containing the current date in the format

```
Fri Mar 19 21:10:57 1993
```

#### Returns

A string containing the timestamp

### 17.45.3.16 get\_input\_line()

```
unsigned int get_input_line (
    char ** string,
    unsigned int options )
```

```
#include <ViennaRNA/utils.h>
```

Retrieve a line from 'stdin' safely while skipping comment characters and other features This function returns the type of input it has read if recognized. An option argument allows one to switch between different reading modes.

Currently available options are:

#VRNA\_INPUT\_NOPRINT\_COMMENTS, [VRNA\\_INPUT\\_NOSKIP\\_COMMENTS](#), #VRNA\_INPUT\_NOELIM\_WS\_SUFFIX

pass a collection of options as one value like this:

```
get_input_line(string, option_1 | option_2 | option_n)
```

If the function recognizes the type of input, it will report it in the return value. It also reports if a user defined 'quit' command (-sign on 'stdin') was given. Possible return values are:

[VRNA\\_INPUT\\_FASTA\\_HEADER](#), [VRNA\\_INPUT\\_ERROR](#), [VRNA\\_INPUT\\_MISC](#), [VRNA\\_INPUT\\_QUIT](#)

#### Parameters

<i>string</i>	A pointer to the character array that contains the line read
<i>options</i>	A collection of options for switching the functions behavior

#### Returns

A flag with information about what has been read

**17.45.3.17 vrna\_message\_input\_seq\_simple()**

```
void vrna_message_input_seq_simple (
    void )
```

```
#include <ViennaRNA/utils.h>
```

Print a line to *stdout* that asks for an input sequence.

There will also be a ruler (scale line) printed that helps orientation of the sequence positions

**17.45.3.18 vrna\_message\_input\_seq()**

```
void vrna_message_input_seq (
    const char * s )
```

```
#include <ViennaRNA/utils.h>
```

Print a line with a user defined string and a ruler to *stdout*.

(usually this is used to ask for user input) There will also be a ruler (scale line) printed that helps orientation of the sequence positions

**Parameters**

<b>s</b>	A user defined string that will be printed to <i>stdout</i>
----------	---

**17.45.3.19 vrna\_idx\_row\_wise()**

```
int* vrna_idx_row_wise (
    unsigned int length )
```

```
#include <ViennaRNA/utils.h>
```

Get an index mapper array (*iindx*) for accessing the energy matrices, e.g. in partition function related functions.

Access of a position "(i,j)" is then accomplished by using

```
(i,j) ~ iindx[i]-j
```

This function is necessary as most of the two-dimensional energy matrices are actually one-dimensional arrays throughout the ViennaRNA Package

Consult the implemented code to find out about the mapping formula ;)

### 17.46.1 Detailed Description

This module contains all functions and variables related to the calculation of global minimum free energy structures for single sequences.

The library provides a fast dynamic programming minimum free energy folding algorithm as described by "Zuker & Stiegler (1981)" [24].

### 17.46.2 Function Documentation

### 17.46.2.1 `vrna_fold()`

```
float vrna_fold (
    const char * sequence,
    char * structure )
```

```
#include <ViennaRNA/fold.h>
```

Compute Minimum Free Energy (MFE), and a corresponding secondary structure for an RNA sequence.

This simplified interface to [vrna\\_mfe\(\)](#) computes the MFE and, if required, a secondary structure for an RNA sequence using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing, e.g. suboptimal backtracking, etc.

#### Note

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_mfe\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

#### See also

[vrna\\_circfold\(\)](#), [vrna\\_mfe\(\)](#), [vrna\\_fold\\_compound\(\)](#), [vrna\\_fold\\_compound\\_t](#)

#### Parameters

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

#### Returns

the minimum free energy (MFE) in kcal/mol

### 17.46.2.2 `vrna_circfold()`

```
float vrna_circfold (
    const char * sequence,
    char * structure )
```

```
#include <ViennaRNA/fold.h>
```

Compute Minimum Free Energy (MFE), and a corresponding secondary structure for a circular RNA sequence.

This simplified interface to [vrna\\_mfe\(\)](#) computes the MFE and, if required, a secondary structure for a circular RNA sequence using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing, e.g. suboptimal backtracking, etc.

Folding of circular RNA sequences is handled as a post-processing step of the forward recursions. See [\[9\]](#) for further details.

**Note**

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_mfe\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

**See also**

[vrna\\_fold\(\)](#), [vrna\\_mfe\(\)](#), [vrna\\_fold\\_compound\(\)](#), [vrna\\_fold\\_compound\\_t](#)

**Parameters**

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

**Returns**

the minimum free energy (MFE) in kcal/mol

**17.46.2.3 fold\_par()**

```
float fold_par (
    const char * sequence,
    char * structure,
    vrna_param_t * parameters,
    int is_constrained,
    int is_circular )
```

```
#include <ViennaRNA/fold.h>
```

Compute minimum free energy and an appropriate secondary structure of an RNA sequence.

The first parameter given, the RNA sequence, must be *uppercase* and should only contain an alphabet  $\Sigma$  that is understood by the RNAlib

(e.g.  $\Sigma = \{A, U, C, G\}$ )

The second parameter, *structure*, must always point to an allocated block of memory with a size of at least `strlen(sequence) + 1`

If the third parameter is NULL, global model detail settings are assumed for the folding recursions. Otherwise, the provided parameters are used.

The fourth parameter indicates whether a secondary structure constraint in enhanced dot-bracket notation is passed through the structure parameter or not. If so, the characters "`| x < >`" are recognized to mark bases that are paired, unpaired, paired upstream, or downstream, respectively. Matching brackets "`( )`" denote base pairs, dots "`.`" are used for unconstrained bases.

To indicate that the RNA sequence is circular and thus has to be post-processed, set the last parameter to non-zero

After a successful call of [fold\\_par\(\)](#), a backtracked secondary structure (in dot-bracket notation) that exhibits the minimum of free energy will be written to the memory *structure* is pointing to. The function returns the minimum of free energy for any fold of the sequence given.

**Note**

OpenMP: Passing NULL to the 'parameters' argument involves access to several global model detail variables and thus is not to be considered threadsafe

**Deprecated** use [vrna\\_mfe\(\)](#) instead!

**See also**

[vrna\\_mfe\(\)](#), [fold\(\)](#), [circfold\(\)](#), [vrna\\_md\\_t](#), [set\\_energy\\_model\(\)](#), [get\\_scaled\\_parameters\(\)](#)

**Parameters**

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to
<i>parameters</i>	A data structure containing the pre-scaled energy contributions and the model details. (NULL may be passed, see OpenMP notes above)
<i>is_constrained</i>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)
<i>is_circular</i>	Switch to (de-)activate post-processing steps in case RNA sequence is circular (0==off)

**Returns**

the minimum free energy (MFE) in kcal/mol

**17.46.2.4 fold()**

```
float fold (
    const char * sequence,
    char * structure )
```

```
#include <ViennaRNA/fold.h>
```

Compute minimum free energy and an appropriate secondary structure of an RNA sequence.

This function essentially does the same thing as [fold\\_par\(\)](#). However, it takes its model details, i.e. [temperature](#), [dangles](#), [tetra\\_loop](#), [noGU](#), [no\\_closingGU](#), [fold\\_constrained](#), [noLonelyPairs](#) from the current global settings within the library

**Deprecated** use [vrna\\_fold\(\)](#), or [vrna\\_mfe\(\)](#) instead!

**See also**

[fold\\_par\(\)](#), [circfold\(\)](#)

## Parameters

<i>sequence</i>	RNA sequence
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

## Returns

the minimum free energy (MFE) in kcal/mol

17.46.2.5 `circfold()`

```
float circfold (
    const char * sequence,
    char * structure )
```

```
#include <ViennaRNA/fold.h>
```

Compute minimum free energy and an appropriate secondary structure of a circular RNA sequence.

This function essentially does the same thing as `fold_par()`. However, it takes its model details, i.e. [temperature](#), [dangles](#), [tetra\\_loop](#), [noGU](#), [no\\_closingGU](#), [fold\\_constrained](#), [noLonelyPairs](#) from the current global settings within the library

**Deprecated** Use `vrna_circfold()`, or `vrna_mfe()` instead!

### 17.47.1 Detailed Description

MFE version of cofolding routines This file includes (almost) all function declarations within the **RNAlib** that are related to MFE Cofolding... This also includes the Zuker suboptimal calculations, since they are implemented using the cofold routines.

### 17.47.2 Function Documentation

17.47.2.1 `vrna_cofold()`

```
float vrna_cofold (
    const char * sequence,
    char * structure )

#include <ViennaRNA/cofold.h>
```

Compute Minimum Free Energy (MFE), and a corresponding secondary structure for two dimerized RNA sequences.

This simplified interface to [vrna\\_mfe\(\)](#) computes the MFE and, if required, a secondary structure for two RNA sequences upon dimerization using default options. Memory required for dynamic programming (DP) matrices will be allocated and free'd on-the-fly. Hence, after return of this function, the recursively filled matrices are not available any more for any post-processing, e.g. suboptimal backtracking, etc.

**Note**

In case you want to use the filled DP matrices for any subsequent post-processing step, or you require other conditions than specified by the default model details, use [vrna\\_mfe\(\)](#), and the data structure [vrna\\_fold\\_compound\\_t](#) instead.

**See also**

[vrna\\_mfe\\_dimer\(\)](#), [vrna\\_fold\\_compound\(\)](#), [vrna\\_fold\\_compound\\_t](#), [vrna\\_cut\\_point\\_insert\(\)](#)

**Parameters**

<i>sequence</i>	two RNA sequences separated by the '&' character
<i>structure</i>	A pointer to the character array where the secondary structure in dot-bracket notation will be written to

**Returns**

the minimum free energy (MFE) in kcal/mol

17.47.2.2 `cofold()`

```
float cofold (
    const char * sequence,
    char * structure )

#include <ViennaRNA/cofold.h>
```

Compute the minimum free energy of two interacting RNA molecules.

The code is analog to the [fold\(\)](#) function. If `cut_point == -1` results should be the same as with [fold\(\)](#).

**Deprecated** use [vrna\\_mfe\\_dimer\(\)](#) instead

## Parameters

<i>sequence</i>	The two sequences concatenated
<i>structure</i>	Will hold the barcket dot structure of the dimer molecule

## Returns

minimum free energy of the structure

17.47.2.3 `cofold_par()`

```
float cofold_par (
    const char * string,
    char * structure,
    vrna_param_t * parameters,
    int is_constrained )
```

```
#include <ViennaRNA/cofold.h>
```

Compute the minimum free energy of two interacting RNA molecules.

**Deprecated** use `vrna_mfe_dimer()` instead

17.47.2.4 `free_co_arrays()`

```
void free_co_arrays (
    void )
```

```
#include <ViennaRNA/cofold.h>
```

Free memory occupied by `cofold()`

**Deprecated** This function will only free memory allocated by a prior call of `cofold()` or `cofold_par()`. See `vrna_mfe_dimer()` for how to use the new API

## Note

folding matrices now reside in the fold compound, and should be free'd there

## See also

`vrna_fc_destroy()`, `vrna_mfe_dimer()`

#### 17.47.2.5 update\_cofold\_params()

```
void update_cofold_params (
    void )
```

```
#include <ViennaRNA/cofold.h>
```

Recalculate parameters.

**Deprecated** See [vrna\\_params\\_subst\(\)](#) for an alternative using the new API

#### 17.47.2.6 update\_cofold\_params\_par()

```
void update_cofold_params_par (
    vrna_param_t * parameters )
```

```
#include <ViennaRNA/cofold.h>
```

Recalculate parameters.

**Deprecated** See [vrna\\_params\\_subst\(\)](#) for an alternative using the new API

#### 17.47.2.7 export\_cofold\_arrays\_gq()

```
void export_cofold_arrays_gq (
    int ** f5_p,
    int ** c_p,
    int ** fML_p,
    int ** fMl_p,
    int ** fc_p,
    int ** ggg_p,
    int ** indx_p,
    char ** ptype_p )
```

```
#include <ViennaRNA/cofold.h>
```

Export the arrays of partition function cofold (with gquadraplex support)

Export the cofold arrays for use e.g. in the concentration Computations or suboptimal secondary structure backtracking

**Deprecated** folding matrices now reside within the fold compound. Thus, this function will only work in conjunction with a prior call to [cofold\(\)](#) or [cofold\\_par\(\)](#)

See also

[vrna\\_mfe\\_dimer\(\)](#) for the new API

## Parameters

<i>f5_p</i>	A pointer to the 'f5' array, i.e. array containing best free energy in interval [1..j]
<i>c_p</i>	A pointer to the 'c' array, i.e. array containing best free energy in interval [i..j] given that i pairs with j
<i>fML_p</i>	A pointer to the 'M' array, i.e. array containing best free energy in interval [i..j] for any multiloop segment with at least one stem
<i>fM1_p</i>	A pointer to the 'M1' array, i.e. array containing best free energy in interval [i..j] for multiloop segment with exactly one stem
<i>fc_p</i>	A pointer to the 'fc' array, i.e. array ...
<i>ggg_p</i>	A pointer to the 'ggg' array, i.e. array containing best free energy of a gquadruplex delimited by [i..j]
<i>indx_p</i>	A pointer to the indexing array used for accessing the energy matrices
<i>ptype_p</i>	A pointer to the ptype array containing the base pair types for each possibility (i,j)

## 17.47.2.8 export\_cofold\_arrays()

```
void export_cofold_arrays (
    int ** f5_p,
    int ** c_p,
    int ** fML_p,
    int ** fM1_p,
    int ** fc_p,
    int ** indx_p,
    char ** ptype_p )
```

```
#include <ViennaRNA/cofold.h>
```

Export the arrays of partition function cofold.

Export the cofold arrays for use e.g. in the concentration Computations or suboptimal secondary structure backtracking

**Deprecated** folding matrices now reside within the [vrna\\_fold\\_compound\\_t](#). Thus, this function will only work in conjunction with a prior call to the deprecated functions [cofold\(\)](#) or [cofold\\_par\(\)](#)

Compute the minimum free energy of two interacting RNA molecules.

The code is analog to the [vrna\\_mfe\(\)](#) function.

## Parameters

<i>vc</i>	fold compound
<i>structure</i>	Will hold the barcket dot structure of the dimer molecule

## Returns

minimum free energy of the structure

### 17.48.1 Detailed Description

Partition Function Cofolding.

To simplify the implementation the partition function computation is done internally in a null model that does not include the duplex initiation energy, i.e. the entropic penalty for producing a dimer from two monomers). The resulting free energies and pair probabilities are initially relative to that null model. In a second step the free energies can be corrected to include the dimerization penalty, and the pair probabilities can be divided into the conditional pair probabilities given that a re dimer is formed or not formed. See [2] for further details.

As for folding one RNA molecule, this computes the partition function of all possible structures and the base pair probabilities. Uses the same global [pf\\_scale](#) variable to avoid overflows.

To simplify the implementation the partition function computation is done internally in a null model that does not include the duplex initiation energy, i.e. the entropic penalty for producing a dimer from two monomers). In a second step the free energies can be corrected to include the dimerization penalty, and the pair probabilities can be divided into the conditional pair probabilities given that a re dimer is formed or not formed.

After computing the partition functions of all possible dimers one can compute the probabilities of base pairs, the concentrations out of start concentrations and sofar and soaway.

Dimer formation is inherently concentration dependent. Given the free energies of the monomers A and B and dimers AB, AA, and BB one can compute the equilibrium concentrations, given input concentrations of A and B, see e.g. Dimitrov & Zuker (2004)

## 17.48.3 Function Documentation

### 17.48.3.1 vrna\_pf\_dimer()

```
vrna_dimer_pf_t vrna_pf_dimer (  
    vrna_fold_compound_t * vc,  
    char * structure )
```

```
#include <ViennaRNA/part_func_co.h>
```

Calculate partition function and base pair probabilities of nucleic acid/nucleic acid dimers.

This is the cofold partition function folding.

#### See also

[vrna\\_fold\\_compound\(\)](#) for how to retrieve the necessary data structure

#### Parameters

<i>vc</i>	the fold compound data structure
<i>structure</i>	Will hold the structure or constraints

#### Returns

`vrna_dimer_pf_t` structure containing a set of energies needed for concentration computations.

**SWIG Wrapper Notes** This function is attached as method **pf\_dimer()** to objects of type *fold\_compound*

17.48.3.2 `vrna_pf_dimer_probs()`

```
void vrna_pf_dimer_probs (
    double FAB,
    double FA,
    double FB,
    vrna_ep_t * prAB,
    const vrna_ep_t * prA,
    const vrna_ep_t * prB,
    int Alength,
    const vrna_exp_param_t * exp_params )
```

```
#include <ViennaRNA/part_func_co.h>
```

Compute Boltzmann probabilities of dimerization without homodimers.

Given the pair probabilities and free energies (in the null model) for a dimer AB and the two constituent monomers A and B, compute the conditional pair probabilities given that a dimer AB actually forms. Null model pair probabilities are given as a list as produced by `vrna_plist_from_probs()`, the dimer probabilities 'prAB' are modified in place.

## Parameters

<i>FAB</i>	free energy of dimer AB
<i>FA</i>	free energy of monomer A
<i>FB</i>	free energy of monomer B
<i>prAB</i>	pair probabilities for dimer
<i>prA</i>	pair probabilities monomer
<i>prB</i>	pair probabilities monomer
<i>Alength</i>	Length of molecule A
<i>exp_params</i>	The precomputed Boltzmann factors

17.48.3.3 `vrna_pf_dimer_concentrations()`

```
vrna_dimer_conc_t* vrna_pf_dimer_concentrations (
    double FcAB,
    double FcAA,
    double FcBB,
    double FEA,
    double FEB,
    const double * startconc,
    const vrna_exp_param_t * exp_params )
```

```
#include <ViennaRNA/part_func_co.h>
```

Given two start monomer concentrations a and b, compute the concentrations in thermodynamic equilibrium of all dimers and the monomers.

This function takes an array 'startconc' of input concentrations with alternating entries for the initial concentrations of molecules A and B (terminated by two zeroes), then computes the resulting equilibrium concentrations from the free energies for the dimers. Dimer free energies should be the dimer-only free energies, i.e. the FcAB entries from the `vrna_dimer_pf_t` struct.

## Parameters

<i>FcAB</i>	Free energy of AB dimer (FcAB entry)
<i>FcAA</i>	Free energy of AA dimer (FcAB entry)
<i>FcBB</i>	Free energy of BB dimer (FcAB entry)
<i>FEA</i>	Free energy of monomer A
<i>FEB</i>	Free energy of monomer B
<i>startconc</i>	List of start concentrations [a0],[b0],[a1],[b1],...,[an],[bn],[0],[0]
<i>exp_params</i>	The precomputed Boltzmann factors

## Returns

vrna\_dimer\_conc\_t array containing the equilibrium energies and start concentrations

### 17.49.1 Detailed Description

RNA-RNA interaction as a stepwise process.

In this approach to cofolding the interaction between two RNA molecules is seen as a stepwise process. In a first step, the target molecule has to adopt a structure in which a binding site is accessible. In a second step, the ligand molecule will hybridize with a region accessible to an interaction. Consequently the algorithm is designed as a two step process: The first step is the calculation of the probability that a region within the target is unpaired, or equivalently, the calculation of the free energy needed to expose a region. In the second step we compute the free energy of an interaction for every possible binding site.

### 17.49.2 Function Documentation

#### 17.49.2.1 `pf_unstru()`

```
pu_contrib* pf_unstru (
    char * sequence,
    int max_w )

#include <ViennaRNA/part_func_up.h>
```

Calculate the partition function over all unpaired regions of a maximal length.

You have to call function `pf_fold()` providing the same sequence before calling `pf_unstru()`. If you want to calculate unpaired regions for a constrained structure, set variable 'structure' in function '`pf_fold()`' to the constrain string. It returns a `pu_contrib` struct containing four arrays of dimension  $[i = 1 \text{ to } \text{length}(\text{sequence})][j = 0 \text{ to } u-1]$  containing all possible contributions to the probabilities of unpaired regions of maximum length  $u$ . Each array in `pu_contrib` contains one of the contributions to the total probability of being unpaired: The probability of being unpaired within an exterior loop is in array `pu_contrib->E`, the probability of being unpaired within a hairpin loop is in array `pu_contrib->H`, the probability of being unpaired within an interior loop is in array `pu_contrib->I` and probability of being unpaired within a multi-loop is in array `pu_contrib->M`. The total probability of being unpaired is the sum of the four arrays of `pu_contrib`.

This function frees everything allocated automatically. To free the output structure call `free_pu_contrib()`.

## Parameters

<i>sequence</i>	
<i>max_w</i>	

## Returns

## 17.49.2.2 pf\_interact()

```

interact* pf_interact (
    const char * s1,
    const char * s2,
    pu_contrib * p_c,
    pu_contrib * p_c2,
    int max_w,
    char * cstruc,
    int incr3,
    int incr5 )

```

```
#include <ViennaRNA/part_func_up.h>
```

Calculates the probability of a local interaction between two sequences.

The function considers the probability that the region of interaction is unpaired within 's1' and 's2'. The longer sequence has to be given as 's1'. The shorter sequence has to be given as 's2'. Function [pf\\_unstru\(\)](#) has to be called for 's1' and 's2', where the probabilities of being unpaired have to be given in 'p\_c' and 'p\_c2', respectively. If you do not want to include the probabilities of being unpaired for 's2' set 'p\_c2' to NULL. If variable 'cstruc' is not NULL, constrained folding is done: The available constrains for intermolecular interaction are: '.' (no constrain), 'x' (the base has no intermolecular interaction) and '|' (the corresponding base has to be paired intermolecularly).

The parameter 'w' determines the maximal length of the interaction. The parameters 'incr5' and 'incr3' allows inclusion of unpaired residues left ('incr5') and right ('incr3') of the region of interaction in 's1'. If the 'incr' options are used, function [pf\\_unstru\(\)](#) has to be called with  $w=w+incr5+incr3$  for the longer sequence 's1'.

It returns a structure of type [interact](#) which contains the probability of the best local interaction including residue  $i$  in  $P_i$  and the minimum free energy in  $G_i$ , where  $i$  is the position in sequence 's1'. The member  $G_{ikjl}$  of structure [interact](#) is the best interaction between region  $[k,i]$   $k < i$  in longer sequence 's1' and region  $[j,l]$   $j < l$  in 's2'.  $G_{ikjl\_wo}$  is  $G_{ikjl}$  without the probability of being unpaired.

Use [free\\_interact\(\)](#) to free the returned structure, all other stuff is freed inside [pf\\_interact\(\)](#).

## Parameters

<i>s1</i>	
<i>s2</i>	
<i>p_c</i>	
<i>p_c2</i>	
<i>max<sub>↔</sub></i> <i>_w</i>	
<i>cstruc</i>	
<i>incr3</i>

Compute base pair probabilities using a sliding-window approach (callback version)

This is a simplified wrapper to [vrna\\_probs\\_window\(\)](#) that given a nucleic acid sequence, a window size, a maximum base pair span, and a cutoff value computes the pair probabilities for any base pair in any window. It is similar to [vrna\\_pfl\\_fold\(\)](#) but uses a callback mechanism to return the pair probabilities.

Read the details for [vrna\\_probs\\_window\(\)](#) for details on the callback implementation!

**Note**

This function uses default model settings! For custom model settings, we refer to the function [vrna\\_probs\\_window\(\)](#).

**See also**

[vrna\\_probs\\_window\(\)](#), [vrna\\_pfl\\_fold\(\)](#), [vrna\\_pfl\\_fold\\_up\\_cb\(\)](#)

**Parameters**

<i>sequence</i>	The nucleic acid input sequence
<i>window_size</i>	The size of the sliding window
<i>max_bp_span</i>	The maximum distance along the backbone between two nucleotides that form a base pairs
<i>cb</i>	The callback function which collects the pair probability data for further processing
<i>data</i>	Some arbitrary data structure that is passed to the callback <i>cb</i>

**17.51.3.3 vrna\_pfl\_fold\_up()**

```
double** vrna_pfl_fold_up (
    const char * sequence,
    int ulength,
    int window_size,
    int max_bp_span )
```

```
#include <ViennaRNA/LPfold.h>
```

Compute probability of contiguous unpaired segments.

This is a simplified wrapper to [vrna\\_probs\\_window\(\)](#) that given a nucleic acid sequence, a maximum length of unpaired segments (*ulength*), a window size, and a maximum base pair span computes the equilibrium probability of any segment not exceeding *ulength*. The probabilities to be unpaired are returned as a 1-based, 2-dimensional matrix with dimensions  $N \times M$ , where  $N$  is the length of the sequence and  $M$  is the maximum segment length. As an example, the probability of a segment of size 5 starting at position 100 is stored in the matrix entry  $X[100][5]$ .

It is the users responsibility to free the memory occupied by this matrix.

**Note**

This function uses default model settings! For custom model settings, we refer to the function [vrna\\_probs\\_window\(\)](#).

**Parameters**

<i>sequence</i>	The nucleic acid input sequence
<i>ulength</i>	The maximal length of an unpaired segment
<i>window_size</i>	The size of the sliding window
<i>max_bp_span</i>	The maximum distance along the backbone between two nucleotides that form a base pairs

**Returns**

The probabilities to be unpaired for any segment not exceeding `ulength`

**17.51.3.4 `vrna_pfl_fold_up_cb()`**

```
void vrna_pfl_fold_up_cb (
    const char * sequence,
    int ulength,
    int window_size,
    int max_bp_span,
    vrna_probs_window_callback * cb,
    void * data )
```

```
#include <ViennaRNA/LPfold.h>
```

Compute probability of contiguous unpaired segments.

This is a simplified wrapper to [vrna\\_probs\\_window\(\)](#) that given a nucleic acid sequence, a maximum length of unpaired segments (`ulength`), a window size, and a maximum base pair span computes the equilibrium probability of any segment not exceeding `ulength`. It is similar to [vrna\\_pfl\\_fold\\_up\(\)](#) but uses a callback mechanism to return the unpaired probabilities.

Read the details for [vrna\\_probs\\_window\(\)](#) for details on the callback implementation!

**Note**

This function uses default model settings! For custom model settings, we refer to the function [vrna\\_probs\\_window\(\)](#).

**Parameters**

<i>sequence</i>	The nucleic acid input sequence
<i>ulength</i>	The maximal length of an unpaired segment
<i>window_size</i>	The size of the sliding window
<i>max_bp_span</i>	The maximum distance along the backbone between two nucleotides that form a base pairs
<i>cb</i>	The callback function which collects the pair probability data for further processing
<i>data</i>	Some arbitrary data structure that is passed to the callback <code>cb</code>

**Returns**

The probabilities to be unpaired for any segment not exceeding `ulength`

**17.51.3.5 `vrna_probs_window()`**

```
void vrna_probs_window (
    vrna_fold_compound_t * fc,
```

```
int ulength,  
unsigned int options,  
vrna_probs_window_callback * cb,  
void * data )
```

```
#include <ViennaRNA/LPfold.h>
```

Compute various equilibrium probabilities under a sliding window approach.

Flag to indicate dumping the energy contributions from the library instead of an input file

### 17.54.3 Function Documentation

#### 17.54.3.1 `convert_parameter_file()`

```
void convert_parameter_file (
    const char * iname,
    const char * oname,
    unsigned int options )
```

```
#include <ViennaRNA/convert_epars.h>
```

Convert/dump a Vienna 1.8.4 formatted energy parameter file

The options argument allows one to control the different output modes.

Currently available options are:

`VRNA_CONVERT_OUTPUT_ALL`, `VRNA_CONVERT_OUTPUT_HP`, `VRNA_CONVERT_OUTPUT_STACK`  
`VRNA_CONVERT_OUTPUT_MM_HP`, `VRNA_CONVERT_OUTPUT_MM_INT`, `VRNA_CONVERT_OUTPUT_MM_INT_1N`  
`VRNA_CONVERT_OUTPUT_MM_INT_23`, `VRNA_CONVERT_OUTPUT_MM_MULTI`, `VRNA_CONVERT_OUTPUT_MM_EXT`  
`VRNA_CONVERT_OUTPUT_DANGLE5`, `VRNA_CONVERT_OUTPUT_DANGLE3`, `VRNA_CONVERT_OUTPUT_INT_11`  
`VRNA_CONVERT_OUTPUT_INT_21`, `VRNA_CONVERT_OUTPUT_INT_22`, `VRNA_CONVERT_OUTPUT_BULGE`  
`VRNA_CONVERT_OUTPUT_INT`, `VRNA_CONVERT_OUTPUT_ML`, `VRNA_CONVERT_OUTPUT_MISC`  
`VRNA_CONVERT_OUTPUT_SPECIAL_HP`, `VRNA_CONVERT_OUTPUT_VANILLA`, `VRNA_CONVERT_OUTPUT_NINIO`  
`VRNA_CONVERT_OUTPUT_DUMP`

The defined options are fine for bitwise compare- and assignment-operations, e. g.: pass a collection of options as a single value like this:

```
convert_parameter_file(ifile, ofile, option_1 | option_2 | option_n)
```

#### Parameters

<i>iname</i>	The input file name (If NULL input is read from stdin)
<i>oname</i>	The output file name (If NULL output is written to stdout)
<i>options</i>	The options (as described above)

### 17.55.1 Detailed Description

This module provides interfaces that deal with the most basic data structure used in structure predicting and energy evaluating function of the RNAlib.

Throughout the entire RNAlib, the [vrna\\_fold\\_compound\\_t](#), is used to group information and data that is required for structure prediction and energy evaluation. Here, you'll find interface functions to create, modify, and delete [vrna\\_fold\\_compound\\_t](#) data structures.

### 17.55.2 Data Structure Documentation

#### 17.55.2.1 struct [vrna\\_fc\\_s](#)

The most basic data structure required by many functions throughout the RNAlib.

#### Note

Please read the documentation of this data structure carefully! Some attributes are only available for specific types this data structure can adopt.

#### Warning

Reading/Writing from/to attributes that are not within the scope of the current type usually result in undefined behavior!

**SWIG Wrapper Notes** This data structure is wrapped as an object **fold\_compound** with several related functions attached as methods.

A new **fold\_compound** can be obtained by calling one of its constructors:

- *fold\_compound(seq)* – Initialize with a single sequence, or two concatenated sequences separated by an ampersand character '&' (for cofolding)
- *fold\_compound(aln)* – Initialize with a sequence alignment *aln* stored as a list of sequences (with gap characters)

The resulting object has a list of attached methods which in most cases directly correspond to functions that mainly operate on the corresponding *C* data structure:

- *type()* – Get the type of the *fold\_compound* (See [vrna\\_fc\\_type\\_e](#))
- *length()* – Get the length of the sequence(s) or alignment stored within the *fold\_compound*

## 17.55.4 Typedef Documentation

### 17.55.4.1 vrna\_callback\_free\_auxdata

```
typedef void() vrna_callback_free_auxdata(void *data)  
  
#include <ViennaRNA/fold_compound.h>
```

Callback to free memory allocated for auxiliary user-provided data.

This type of user-implemented function usually deletes auxiliary data structures. The user must take care to free all the memory occupied by the data structure passed.

**Notes on Callback Functions** This callback is supposed to free memory occupied by an auxiliary data structure. It will be called when the [vrna\\_fold\\_compound\\_t](#) is erased from memory through a call to [vrna\\_fold\\_compound\\_free\(\)](#) and will be passed the address of memory previously bound to the [vrna\\_fold\\_compound\\_t](#) via [vrna\\_fold\\_compound\\_add\\_auxdata\(\)](#).

See also

[vrna\\_fold\\_compound\\_add\\_auxdata\(\)](#), [vrna\\_fold\\_compound\\_free\(\)](#), [vrna\\_fold\\_compound\\_add\\_callback\(\)](#)

## Parameters

<i>data</i>	The data that needs to be free'd
-------------	----------------------------------

17.55.4.2 `vrna_callback_recursion_status`

```
typedef void() vrna_callback_recursion_status(unsigned char status, void *data)
```

```
#include <ViennaRNA/fold_compound.h>
```

Callback to perform specific user-defined actions before, or after recursive computations.

**Notes on Callback Functions** This function will be called to notify a third-party implementation about the status of a currently ongoing recursion. The purpose of this callback mechanism is to provide users with a simple way to ensure pre- and post conditions for auxiliary mechanisms attached to our implementations.

<i>status</i>	The status indicator
<i>data</i>	The data structure that was assigned with <a href="#">vrna_fold_compound_add_auxdata()</a>
<i>status</i>	The status indicator

## 17.55.5 Enumeration Type Documentation

17.55.5.1 `vrna_fc_type_e`

```
enum vrna_fc_type_e
```

```
#include <ViennaRNA/fold_compound.h>
```

An enumerator that is used to specify the type of a [vrna\\_fold\\_compound\\_t](#).

## Enumerator

<code>VRNA_FC_TYPE_SINGLE</code>	Type is suitable for single, and hybridizing sequences
<code>VRNA_FC_TYPE_COMPARATIVE</code>	Type is suitable for sequence alignments (consensus structure prediction)

## 17.55.6 Function Documentation

### 17.55.6.1 `vrna_fold_compound()`

```
vrna_fold_compound_t* vrna_fold_compound (
    const char * sequence,
    vrna_md_t * md_p,
    unsigned int options )

#include <ViennaRNA/fold_compound.h>
```

Retrieve a `vrna_fold_compound_t` data structure for single sequences and hybridizing sequences.

This function provides an easy interface to obtain a prefilled `vrna_fold_compound_t` by passing a single sequence, or two concatenated sequences as input. For the latter, sequences need to be separated by an '&' character like this:

```
char *sequence = "GGGG&CCCC";
```

The optional parameter `md_p` can be used to specify the model details for successive computations based on the content of the generated `vrna_fold_compound_t`. Passing NULL will instruct the function to use default model details. The third parameter `options` may be used to specify dynamic programming (DP) matrix requirements. Use the macros:

- `VRNA_OPTION_MFE`
- `VRNA_OPTION_PF`
- `VRNA_OPTION_WINDOW`
- `VRNA_OPTION_EVAL_ONLY`
- `VRNA_OPTION_DEFAULT`

to specify the required type of computations that will be performed with the `vrna_fold_compound_t`.

If you just need the folding compound serving as a container for your data, you can simply pass `VRNA_OPTION_DEFAULT` to the `option` parameter. This creates a `vrna_fold_compound_t` without DP matrices, thus saving memory. Subsequent calls of any structure prediction function will then take care of allocating the memory required for the DP matrices. If you only intend to evaluate structures instead of actually predicting them, you may use the `VRNA_OPTION_EVAL_ONLY` macro. This will seriously speedup the creation of the `vrna_fold_compound_t`.

#### Note

The sequence string must be uppercase, and should contain only RNA (resp. DNA) alphabet depending on what energy parameter set is used

## Parameters

<i>sequence</i>	A single sequence, or two concatenated sequences seperated by an '&' character
<i>md_p</i>	An optional set of model details
<i>options</i>	The options for DP matrices memory allocation

## Returns

A prefilled `vrna_fold_compound_t` that can be readily used for computations

17.55.6.2 `vrna_fold_compound_comparative()`

```
vrna_fold_compound_t* vrna_fold_compound_comparative (
    const char ** sequences,
    vrna_md_t * md_p,
    unsigned int options )
```

```
#include <ViennaRNA/fold_compound.h>
```

Retrieve a `vrna_fold_compound_t` data structure for sequence alignments.

This function provides an easy interface to obtain a prefilled `vrna_fold_compound_t` by passing an alignment of sequences.

The optional parameter `md_p` can be used to specify the model details for successive computations based on the content of the generated `vrna_fold_compound_t`. Passing NULL will instruct the function to use default model details. The third parameter `options` may be used to specify dynamic programming (DP) matrix requirements. Use the macros:

- `VRNA_OPTION_MFE`
- `VRNA_OPTION_PF`
- `VRNA_OPTION_EVAL_ONLY`
- `VRNA_OPTION_DEFAULT`

to specify the required type of computations that will be performed with the `vrna_fold_compound_t`.

If you just need the folding compound serving as a container for your data, you can simply pass `VRNA_OPTION_DEFAULT` to the `option` parameter. This creates a `vrna_fold_compound_t` without DP matrices, thus saving memory. Subsequent calls of any structure prediction function will then take care of allocating the memory required for the DP matrices. If you only intend to evaluate structures instead of actually predicting them, you may use the `VRNA_OPTION_EVAL_ONLY` macro. This will seriously speedup the creation of the `vrna_fold_compound_t`.

## Note

The sequence strings must be uppercase, and should contain only RNA (resp. DNA) alphabet including gap characters depending on what energy parameter set is used.

`vrna_fold_compound_free()`, `vrna_fold_compound()`, `vrna_md_t`, `VRNA_OPTION_MFE`, `VRNA_OPTION_PF`, `VRNA_OPTION_EVAL_ONLY`, `read_clustal()`

## Parameters

<i>sequences</i>	A sequence alignment including 'gap' characters
<i>md_p</i>	An optional set of model details
<i>options</i>	The options for DP matrices memory allocation

## Returns

A prefilled `vrna_fold_compound_t` that can be readily used for computations

17.55.6.3 `vrna_fold_compound_free()`

```
void vrna_fold_compound_free (
    vrna_fold_compound_t * vc )
```

```
#include <ViennaRNA/fold_compound.h>
```

Free memory occupied by a `vrna_fold_compound_t`.

## See also

## Parameters

<code>vc</code>	The <code>vrna_fold_compound_t</code> that is to be erased from memory
-----------------	--

17.55.6.4 `vrna_fold_compound_add_auxdata()`

```
void vrna_fold_compound_add_auxdata (
    vrna_fold_compound_t * vc,
    void * data,
    vrna_callback_free_auxdata * f )
```

```
#include <ViennaRNA/fold_compound.h>
```

Add auxiliary data to the `vrna_fold_compound_t`.

This function allows one to bind arbitrary data to a `vrna_fold_compound_t` which may later on be used by one of the callback functions, e.g. [vrna\\_callback\\_recursion\\_status\(\)](#). To allow for proper cleanup of the memory occupied by this auxiliary data, the user may also provide a pointer to a cleanup function that free's the corresponding memory. This function will be called automatically when the `vrna_fold_compound_t` is free'd with [vrna\\_fold\\_compound\\_free\(\)](#).

**Note**

Before attaching the arbitrary data pointer, this function will call the [vrna\\_callback\\_free\\_auxdata\(\)](#) on any pre-existing data that is already attached.

**See also**

[vrna\\_callback\\_free\\_auxdata\(\)](#)

**Parameters**

<i>vc</i>	The fold_compound the arbitrary data pointer should be associated with
<i>data</i>	A pointer to an arbitrary data structure
<i>f</i>	A pointer to function that free's memory occupied by the arbitrary data (May be NULL)

**17.55.6.5 vrna\_fold\_compound\_add\_callback()**

```
void vrna_fold_compound_add_callback (
    vrna_fold_compound_t * vc,
    vrna_callback_recursion_status * f )
```

```
#include <ViennaRNA/fold_compound.h>
```

Add a recursion status callback to the [vrna\\_fold\\_compound\\_t](#).

Binding a recursion status callback function to a [vrna\\_fold\\_compound\\_t](#) allows one to perform arbitrary operations just before, or after an actual recursive computations, e.g. MFE prediction, is performed by the RNAlib. The callback function will be provided with a pointer to its [vrna\\_fold\\_compound\\_t](#), and a status message. Hence, it has complete access to all variables that influence the recursive computations.

### 17.56.4 Function Documentation

#### 17.56.4.1 `vrna_mx_add()`

```
int vrna_mx_add (
    vrna_fold_compound_t * vc,
    vrna_mx_type_e type,
    unsigned int options )

#include <ViennaRNA/dp_matrices.h>
```

Add Dynamic Programming (DP) matrices (allocate memory)

This function adds DP matrices of a specific type to the provided `vrna_fold_compound_t`, such that successive DP recursion can be applied. The function caller has to specify which type of DP matrix is requested, see `vrna_mx_type_e`, and what kind of recursive algorithm will be applied later on, using the parameters `type`, and `options`, respectively. For the latter, Minimum free energy (MFE), and Partition function (PF) computations are distinguished. A third option that may be passed is `VRNA_OPTION_HYBRID`, indicating that auxiliary DP arrays are required for RNA-RNA interaction prediction.

#### Note

Usually, there is no need to call this function, since the constructors of `vrna_fold_compound_t` are handling all the DP matrix memory allocation.

#### Parameters

<code>vc</code>	The <code>vrna_fold_compound_t</code> that holds pointers to the DP matrices
<code>type</code>	The type of DP matrices requested
<code>options</code>	Option flags that specify the kind of DP matrices, such as MFE or PF arrays, and auxiliary requirements

#### Returns

1 if DP matrices were properly allocated and attached, 0 otherwise

#### 17.56.4.2 `vrna_mx_mfe_free()`

```
void vrna_mx_mfe_free (
    vrna_fold_compound_t * vc )

#include <ViennaRNA/dp_matrices.h>

## 17.57.4 Function Documentation

### 17.57.4.1 vrna\_path\_findpath\_saddle()

```
int vrna_path_findpath_saddle (
    vrna\_fold\_compound\_t * vc,
    const char * struc1,
    const char * struc2,
    int max )

#include <ViennaRNA/findpath.h>
```

Find energy of a saddle point between 2 structures (search only direct path)

This function uses an implementation of the *findpath* algorithm [5] for near-optimal direct refolding path prediction.

Model details, and energy parameters are used as provided via the parameter 'vc'. The [vrna\\_fold\\_compound\\_t](#) does not require memory for any DP matrices, but requires all most basic init values as one would get from a call like this:

```
vc = vrna\_fold\_compound(sequence, NULL, VRNA\_OPTION\_EVAL\_ONLY);
```

## See also

## Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> with precomputed sequence encoding and model details
<i>struc1</i>	The start structure in dot-bracket notation
<i>struc2</i>	The target structure in dot-bracket notation
<i>max</i>	A number specifying how many structures are being kept at each step during the search

## Returns

The saddle energy in 10cal/mol

#include <ViennaRNA/findpath.h>
```

Find energy of a saddle point between 2 structures (search only direct path)

##### Parameters

<i>seq</i>	RNA sequence
<i>struc1</i>	A pointer to the character array where the first secondary structure in dot-bracket notation will be written to
<i>struc2</i>	A pointer to the character array where the second secondary structure in dot-bracket notation will be written to
<i>max</i>	integer how many structures are being kept during the search

##### Returns

### 17.58.1 Detailed Description

### 17.58.2 Macro Definition Documentation

### 17.58.2.1 FILENAME\_MAX\_LENGTH

```
#define FILENAME_MAX_LENGTH 80
```

```
#include <ViennaRNA/string_utils.h>
```

Maximum length of filenames that are generated by our programs.

This definition should be used throughout the complete ViennaRNA package wherever a static array holding file-names of output files is declared.

### 17.58.2.2 FILENAME\_ID\_LENGTH

```
#define FILENAME_ID_LENGTH 42
```

```
#include <ViennaRNA/string_utils.h>
```

Maximum length of id taken from fasta header for filename generation.

this has to be smaller than FILENAME\_MAX\_LENGTH since in most cases, some suffix will be appended to the ID

## 17.58.3 Function Documentation

### 17.58.3.1 vrna\_strdup\_printf()

```
char* vrna_strdup_printf (
    const char * format,
    ... )
```

```
#include <ViennaRNA/string_utils.h>
```

Safely create a formatted string.

This function is a safe implementation for creating a formatted character array, similar to *sprintf*. Internally, it uses the *asprintf* function if available to dynamically allocate a large enough character array to store the supplied content. If *asprintf* is not available, mimic it's behavior using *vsprintf*.

#### Note

The returned pointer of this function should always be passed to *free()* to release the allocated memory

#### See also

[vrna\\_strdup\\_vprintf\(\)](#), [vrna\\_strcat\\_printf\(\)](#)

## Parameters

<i>format</i>	The format string (See also <code>asprintf</code> )
...	The list of variables used to fill the format string

## Returns

The formatted, null-terminated string, or NULL if something has gone wrong

17.58.3.2 `vrna_strdup_vprintf()`

```
char* vrna_strdup_vprintf (
    const char * format,
    va_list argp )
```

```
#include <ViennaRNA/string_utils.h>
```

Safely create a formatted string.

This function is the *va\_list* version of [vrna\\_strdup\\_printf\(\)](#)

## Note

The returned pointer of this function should always be passed to `free()` to release the allocated memory

## See also

[vrna\\_strdup\\_printf\(\)](#), [vrna\\_strcat\\_printf\(\)](#), [vrna\\_strcat\\_vprintf\(\)](#)

## Parameters

<i>format</i>	The format string (See also <code>asprintf</code> )
...	The list of variables used to fill the format string

## Returns

The formatted, null-terminated string, or NULL if something has gone wrong

17.58.3.3 `vrna_strcat_printf()`

```
int vrna_strcat_printf (
    char ** dest,
    const char * format,
    ... )
```

```
#include <ViennaRNA/string_utils.h>
```

Safely append a formatted string to another string.

This function is a safe implementation for appending a formatted character array, similar to a combination of *strcat* and *sprintf*. The function automatically allocates enough memory to store both, the previous content stored at `dest` and the appended format string. If the `dest` pointer is NULL, the function allocate memory only for the format string. The function returns the number of characters in the resulting string or -1 in case of an error.

See also

[vrna\\_strcat\\_vprintf\(\)](#), [vrna\\_strdup\\_printf\(\)](#), [vrna\\_strdup\\_vprintf\(\)](#)

#### Parameters

<i>dest</i>	The address of a char *pointer where the formatted string is to be appended
<i>format</i>	The format string (See also <code>sprintf</code> )
...	The list of variables used to fill the format string

#### Returns

The number of characters in the final string, or -1 on error

#### 17.58.3.4 vrna\_strcat\_vprintf()

```
int vrna_strcat_vprintf (
    char ** dest,
    const char * format,
    va_list args )
```

```
#include <ViennaRNA/string_utils.h>
```

Safely append a formatted string to another string.

This function is the *va\_list* version of [vrna\\_strcat\\_printf\(\)](#)

See also

[vrna\\_strcat\\_printf\(\)](#), [vrna\\_strdup\\_printf\(\)](#), [vrna\\_strdup\\_vprintf\(\)](#)

#### Parameters

<i>dest</i>	The address of a char *pointer where the formatted string is to be appended
<i>format</i>	The format string (See also <code>sprintf</code> )
...	The list of variables used to fill the format string

### Returns

The number of characters in the final string, or -1 on error

#### 17.58.3.5 `vrna_strsplit()`

```
char** vrna_strsplit (
    const char * string,
    const char * delimiter )

#include <ViennaRNA/string_utils.h>
```

Split a string into tokens using a delimiting character.

This function splits a string into an array of strings using a single character that delimits the elements within the string. The default delimiter is the ampersand ' & ' and will be used when `NULL` is passed as a second argument. The returned list is `NULL` terminated, i.e. the last element is `NULL`. If the delimiter is not found, the returned list contains exactly one element: the input string.

For instance, the following code:

```
char **tok = vrna_strsplit("GGGG&CCCC&AAAA", NULL);

for (char **ptr = tok; *ptr; ptr++) {
    printf("%s\n", *ptr);
    free(*ptr);
}
free(tok);
```

produces this output:

```
GGGG
CCCC
AAAAA
```

and properly free's the memory occupied by the returned element array.

### Note

This function internally uses `strtok_r()` and is therefore considered to be thread-safe. Also note, that it is the users responsibility to free the memory of the array and that of the individual element strings!

### Parameters

<i>string</i>	The input string that should be split into elements
<i>delimiter</i>	The delimiting character. If <code>NULL</code> , the delimiter is " & "

### Returns

A `NULL` terminated list of the elements in the string

### 17.58.3.6 vrna\_random\_string()

```
char* vrna_random_string (
    int l,
    const char symbols[] )

#include <ViennaRNA/string_utils.h>
```

Create a random string using characters from a specified symbol set.

#### Parameters

<i>l</i>	The length of the sequence
<i>symbols</i>	The symbol set

#### Returns

A random string of length 'l' containing characters from the symbolset

### 17.58.3.7 vrna\_hamming\_distance()

```
int vrna_hamming_distance (
    const char * s1,
    const char * s2 )

#include <ViennaRNA/string_utils.h>
```

Calculate hamming distance between two sequences.

#### Parameters

<i>s1</i>	The first sequence
<i>s2</i>	The second sequence

#### Returns

The hamming distance between s1 and s2

### 17.58.3.8 vrna\_hamming\_distance\_bound()

```
int vrna_hamming_distance_bound (
    const char * s1,
    const char * s2,
    int n )
```

```
#include <ViennaRNA/string_utils.h>
```

Calculate hamming distance between two sequences up to a specified length.

This function is similar to `vrna_hamming_distance()` but instead of comparing both sequences up to their actual length only the first `n` characters are taken into account

#### Parameters

<i>s1</i>	The first sequence
<i>s2</i>	The second sequence
<i>n</i>	The length of the subsequences to consider (starting from the 5' end)

#### Returns

The hamming distance between `s1` and `s2`

#### 17.58.3.9 `vrna_seq_toRNA()`

```
void vrna_seq_toRNA (  
    char * sequence )
```

```
#include <ViennaRNA/string_utils.h>
```

Convert an input sequence (possibly containing DNA alphabet characters) to RNA alphabet.

This function substitutes *T* and *t* with *U* and *u*, respectively

#### Parameters

<i>sequence</i>	The sequence to be converted
-----------------	------------------------------

#### 17.58.3.10 `vrna_seq_toupper()`

```
void vrna_seq_toupper (  
    char * sequence )
```

```
#include <ViennaRNA/string_utils.h>
```

Convert an input sequence to uppercase.

#### Parameters

<i>sequence</i>	The sequence to be converted
-----------------	------------------------------

### 17.58.3.11 vrna\_cut\_point\_insert()

```
char* vrna_cut_point_insert (
    const char * string,
    int cp )
```

```
#include <ViennaRNA/string_utils.h>
```

Add a separating '&' character into a string according to cut-point position.

If the cut-point position is less or equal to zero, this function just returns a copy of the provided string. Otherwise, the cut-point character is set at the corresponding position

#### Parameters

<i>string</i>	The original string
<i>cp</i>	The cut-point position

#### Returns

A copy of the provided string including the cut-point character

### 17.58.3.12 vrna\_cut\_point\_remove()

```
char* vrna_cut_point_remove (
    const char * string,
    int * cp )
```

```
#include <ViennaRNA/string_utils.h>
```

Remove a separating '&' character from a string.

This function removes the cut-point indicating '&' character from a string and memorizes its position in a provided integer variable. If not '&' is found in the input, the integer variable is set to -1. The function returns a copy of the input string with the '&' being sliced out.

#### Parameters

<i>string</i>	The original string
<i>cp</i>	The cut-point position

#### Returns

A copy of the input string with the '&' being sliced out

- void [parenthesis\\_structure](#) (char \*structure, [vrna\\_bp\\_stack\\_t](#) \*bp, int length)

Create a dot-bracket/parenthesis structure from backtracking stack.
- void [parenthesis\\_zuker](#) (char \*structure, [vrna\\_bp\\_stack\\_t](#) \*bp, int length)

Create a dot-bracket/parenthesis structure from backtracking stack obtained by Zuker suboptimal calculation in *cofold.c*.
- void [bppm\\_to\\_structure](#) (char \*structure, FLT\_OR\_DBL \*pr, unsigned int length)

Create a dot-bracket like structure string from base pair probability matrix.
- char [bppm\\_symbol](#) (const float \*x)

Get a pseudo dot bracket notation for a given probability information.

## Variables

- int [loop\\_size](#) [STRUC]

contains a list of all loop sizes. *loop\_size[0]* contains the number of external bases.
- int [helix\\_size](#) [STRUC]

contains a list of all stack sizes.
- int [loop\\_degree](#) [STRUC]

- contains the corresponding list of loop degrees.*
  - int [loops](#)
*contains the number of loops ( and therefore of stacks ).*
  - int [unpaired](#)
*contains the number of unpaired bases.*
  - int [pairs](#)
*contains the number of base pairs in the last parsed structure.*

### 17.59.1 Detailed Description

### 17.59.2 Data Structure Documentation

#### 17.59.2.1 struct vrna\_hx\_s

Data structure representing an entry of a helix list.

#### 17.59.2.2 struct vrna\_elem\_prob\_s

Data structure representing a single entry of an element probability list (e.g. list of pair probabilities)

## 17.59.4 Function Documentation

### 17.59.4.1 b2HIT()

```
char* b2HIT (
    const char * structure )

#include <ViennaRNA/RNAstruct.h>
```

Converts the full structure from bracket notation to the HIT notation including root.

#### Parameters

<i>structure</i>	
------------------	--

#### Returns

### 17.59.4.2 b2C()

```
char* b2C (
    const char * structure )

#include <ViennaRNA/RNAstruct.h>
```

Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.

## Parameters

<i>structure</i>	
------------------	--

## Returns

## 17.59.4.3 b2Shapiro()

```
char* b2Shapiro (  
    const char * structure )
```

```
#include <ViennaRNA/RNAstruct.h>
```

Converts the full structure from bracket notation to the *weighted* coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.

## Parameters

<i>structure</i>	
------------------	--

## Returns

## 17.59.4.4 add\_root()

```
char* add_root (  
    const char * structure )
```

```
#include <ViennaRNA/RNAstruct.h>
```

Adds a root to an un-rooted tree in any except bracket notation.

## Parameters

<i>structure</i>	
------------------	--

## Returns

#### 17.59.4.5 expand\_Shapiro()

```
char* expand_Shapiro (
    const char * coarse )
```

```
#include <ViennaRNA/RNAstruct.h>
```

Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).

##### Parameters

<i>coarse</i>	
---------------	--

##### Returns

#### 17.59.4.6 expand\_Full()

```
char* expand_Full (
    const char * structure )
```

```
#include <ViennaRNA/RNAstruct.h>
```

Convert the full structure from bracket notation to the expanded notation including root.

##### Parameters

<i>structure</i>	
------------------	--

##### Returns

#### 17.59.4.7 unexpand\_Full()

```
char* unexpand_Full (
    const char * ffull )
```

```
#include <ViennaRNA/RNAstruct.h>
```

Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.

##### Parameters

<i>ffull</i>	
--------------	--

**Returns****17.59.4.8 unweight()**

```
char* unweight (
    const char * wcoarse )

#include <ViennaRNA/RNAstruct.h>
```

Strip weights from any weighted tree.

**Parameters**

<i>wcoarse</i>	
----------------	--

**Returns****17.59.4.9 unexpand\_aligned\_F()**

```
void unexpand_aligned_F (
    char * align[2] )

#include <ViennaRNA/RNAstruct.h>
```

Converts two aligned structures in expanded notation.

Takes two aligned structures as produced by [tree\\_edit\\_distance\(\)](#) function back to bracket notation with '\_' as the gap character. The result overwrites the input.

**Parameters**

<i>align</i>	
--------------	--

**17.59.4.10 parse\_structure()**

```
void parse_structure (
    const char * structure )

#include <ViennaRNA/RNAstruct.h>
```

Collects a statistic of structure elements of the full structure in bracket notation.

The function writes to the following global variables: `loop_size`, `loop_degree`, `helix_size`, `loops`, `pairs`, `unpaired`

## Parameters

<i>structure</i>	
------------------	--

## Returns

17.59.4.11 `vrna_db_pack()`

```
char* vrna_db_pack (
    const char * struc )
```

```
#include <ViennaRNA/structure_utils.h>
```

Pack secondary structure, 5:1 compression using base 3 encoding.

Returns a binary string encoding of the secondary structure using a 5:1 compression scheme. The string is NULL terminated and can therefore be used with standard string functions such as `strcmp()`. Useful for programs that need to keep many structures in memory.

## See also

[vrna\\_db\\_unpack\(\)](#)

## Parameters

<i>struc</i>	The secondary structure in dot-bracket notation
--------------	---

## Returns

The binary encoded structure

17.59.4.12 `vrna_db_unpack()`

```
char* vrna_db_unpack (
    const char * packed )
```

```
#include <ViennaRNA/structure_utils.h>
```

Unpack secondary structure previously packed with [vrna\\_db\\_pack\(\)](#)

Translate a compressed binary string produced by [vrna\\_db\\_pack\(\)](#) back into the familiar dot-bracket notation.

## See also

[vrna\\_db\\_pack\(\)](#)

## Parameters

<i>packed</i>	The binary encoded packed secondary structure
---------------	---

## Returns

The unpacked secondary structure in dot-bracket notation

17.59.4.13 `vrna_ptable()`

```
short* vrna_ptable (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a pair table of a secondary structure.

Returns a newly allocated table, such that `table[i]=j` if (i,j) pair or 0 if i is unpaired, `table[0]` contains the length of the structure.

## See also

[vrna\\_ptable\\_from\\_string\(\)](#), [vrna\\_db\\_from\\_ptable\(\)](#)

## Parameters

<i>structure</i>	The secondary structure in dot-bracket notation
------------------	---

## Returns

A pointer to the created `pair_table`

17.59.4.14 `vrna_ptable_from_string()`

```
short* vrna_ptable_from_string (
    const char * string,
    unsigned int options )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a pair table for a secondary structure string.

This function takes an input string of a secondary structure annotation in [Dot-Bracket Notation](#) (a.k.a. [Dot-Parenthesis Notation](#)) or [Extended Dot-Bracket Notation](#), and converts it into a pair table representation.

## See also

[vrna\\_ptable\(\)](#), [vrna\\_db\\_from\\_ptable\(\)](#), [vrna\\_db\\_flatten\\_to\(\)](#), [VRNA\\_BRACKETS\\_RND](#), [VRNA\\_BRACKETS\\_ANG](#), [VRNA\\_BRACKETS\\_CLY](#), [VRNA\\_BRACKETS\\_SQR](#), [VRNA\\_BRACKETS\\_DEFAULT](#)

## Parameters

<i>string</i>	Secondary structure in <a href="#">Extended Dot-Bracket Notation</a>
<i>options</i>	A bitmask to specify which brackets are recognized during conversion to pair table

## Returns

A pointer to a new pair table of the provided secondary structure

17.59.4.15 `vrna_pt_pk_get()`

```
short* vrna_pt_pk_get (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a pair table of a secondary structure (pseudo-knot version)

Returns a newly allocated table, such that `table[i]=j` if (i,j) pair or 0 if i is unpaired, `table[0]` contains the length of the structure.

In contrast to [vrna\\_ptable\(\)](#) this function also recognizes the base pairs denoted by '[' and ']' brackets.

## Parameters

<i>structure</i>	The secondary structure in (extended) dot-bracket notation
------------------	--

## Returns

A pointer to the created `pair_table`

17.59.4.16 `vrna_ptable_copy()`

```
short* vrna_ptable_copy (
    const short * pt )
```

```
#include <ViennaRNA/structure_utils.h>
```

Get an exact copy of a pair table.

## Parameters

<i>pt</i>	The pair table to be copied
-----------	-----------------------------

**Returns**

A pointer to the copy of 'pt'

**17.59.4.17 vrna\_pt\_snoop\_get()**

```
short* vrna_pt_snoop_get (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a pair table of a secondary structure (snoop version)

returns a newly allocated table, such that: table[i]=j if (i,j) pair or 0 if i is unpaired, table[0] contains the length of the structure. The special pseudoknotted H/ACA-mRNA structure is taken into account.

**17.59.4.18 vrna\_db\_flatten()**

```
vrna_db_flatten (
    char * string,
    unsigned int options )
```

```
#include <ViennaRNA/structure_utils.h>
```

Substitute pairs of brackets in a string with parenthesis.

This function can be used to replace brackets of unusual types, such as angular brackets <> , to dot-bracket format. The *options* parameter is used to specify which types of brackets will be replaced by round parenthesis () .

**See also**

[vrna\\_db\\_flatten\\_to\(\)](#), [VRNA\\_BRACKETS\\_RND](#), [VRNA\\_BRACKETS\\_ANG](#), [VRNA\\_BRACKETS\\_CLY](#), [VRNA\\_BRACKETS\\_SQR](#), [VRNA\\_BRACKETS\\_DEFAULT](#)

**Parameters**

<i>structure</i>	The structure string where brackets are flattened in-place
<i>options</i>	A bitmask to specify which types of brackets should be flattened out

**SWIG Wrapper Notes** This function flattens an input structure string in-place! The second parameter is optional and defaults to [VRNA\\_BRACKETS\\_DEFAULT](#).

An overloaded version of this function exists, where an additional second parameter can be passed to specify the target brackets, i.e. the type of matching pair characters all brackets will be flattened to. Therefore, in the scripting language interface this function is a replacement for [vrna\\_db\\_flatten\\_to\(\)](#).

17.59.4.19 `vrna_db_flatten_to()`

```
void vrna_db_flatten_to (
    char * string,
    const char target[3],
    unsigned int options )
```

```
#include <ViennaRNA/structure_utils.h>
```

Substitute pairs of brackets in a string with another type of pair characters.

This function can be used to replace brackets in a structure annotation string, such as square brackets `[]`, to another type of pair characters, e.g. angular brackets `<>`.

The `target` array must contain a character for the 'pair open' annotation at position 0, and one for 'pair close' at position 1. The `options` parameter is used to specify which types of brackets will be replaced by the new pairs.

**See also**

[vrna\\_db\\_flatten\(\)](#), [VRNA\\_BRACKETS\\_RND](#), [VRNA\\_BRACKETS\\_ANG](#), [VRNA\\_BRACKETS\\_CLY](#), [VRNA\\_BRACKETS\\_SQR](#), [VRNA\\_BRACKETS\\_DEFAULT](#)

**Parameters**

<i>structure</i>	The structure string where brackets are flattened in-place
<i>target</i>	The new pair characters the string will be flattened to
<i>options</i>	A bitmask to specify which types of brackets should be flattened out

**SWIG Wrapper Notes** This function is available as an overloaded version of [vrna\\_db\\_flatten\(\)](#)

17.59.4.20 `vrna_db_from_ptable()`

```
char* vrna_db_from_ptable (
    short * pt )
```

```
#include <ViennaRNA/structure_utils.h>
```

Convert a pair table into dot-parenthesis notation.

**Parameters**

<i>pt</i>	The pair table to be copied
-----------	-----------------------------

**Returns**

A char pointer to the dot-bracket string

#### 17.59.4.21 vrna\_db\_from\_WUSS()

```
char* vrna_db_from_WUSS (
    const char * wuss )
```

```
#include <ViennaRNA/structure_utils.h>
```

Convert a WUSS annotation string to dot-bracket format.

##### Note

This function flattens all brackets, and treats pseudo-knots annotated by matching pairs of upper/lowercase letters as unpaired nucleotides

##### See also

[Washington University Secondary Structure \(WUSS\) notation](#)

##### Parameters

<i>wuss</i>	The input string in WUSS notation
-------------	-----------------------------------

##### Returns

A dot-bracket notation of the input secondary structure

#### 17.59.4.22 vrna\_bp\_distance()

```
int vrna_bp_distance (
    const char * str1,
    const char * str2 )
```

```
#include <ViennaRNA/structure_utils.h>
```

Compute the "base pair" distance between two secondary structures s1 and s2.

The sequences should have the same length. dist = number of base pairs in one structure but not in the other same as edit distance with open-pair close-pair as move-set

##### Parameters

<i>str1</i>	First structure in dot-bracket notation
<i>str2</i>	Second structure in dot-bracket notation

##### Returns

The base pair distance between str1 and str2

17.59.4.23 `vrna_refBPcnt_matrix()`

```
unsigned int* vrna_refBPcnt_matrix (
    const short * reference_pt,
    unsigned int turn )

#include <ViennaRNA/structure_utils.h>
```

Make a reference base pair count matrix.

Get an upper triangular matrix containing the number of basepairs of a reference structure for each interval  $[i,j]$  with  $i < j$ . Access it via `iindx!!!`

17.59.4.24 `vrna_refBPdist_matrix()`

```
unsigned int* vrna_refBPdist_matrix (
    const short * pt1,
    const short * pt2,
    unsigned int turn )

#include <ViennaRNA/structure_utils.h>
```

Make a reference base pair distance matrix.

Get an upper triangular matrix containing the base pair distance of two reference structures for each interval  $[i,j]$  with  $i < j$ . Access it via `iindx!!!`

17.59.4.25 `vrna_db_from_bp_stack()`

```
char* vrna_db_from_bp_stack (
    vrna_bp_stack_t * bp,
    unsigned int length )

#include <ViennaRNA/structure_utils.h>
```

Create a dot-bracket/parenthesis structure from backtracking stack.

This function is capable to create dot-bracket structures from suboptimal structure prediction sensu M. Zuker

**Parameters**

<i>bp</i>	Base pair stack containing the traced base pairs
<i>length</i>	The length of the structure

**Returns**

The secondary structure in dot-bracket notation as provided in the input

#### 17.59.4.26 vrna\_plist()

```
vrna_ep_t* vrna_plist (
    const char * struc,
    float pr )

#include <ViennaRNA/structure_utils.h>
```

Create a `vrna_ep_t` from a dot-bracket string.

The dot-bracket string is parsed and for each base pair an entry in the plist is created. The probability of each pair in the list is set by a function parameter.

The end of the plist is marked by sequence positions *i* as well as *j* equal to 0. This condition should be used to stop looping over its entries

##### Parameters

<i>struc</i>	The secondary structure in dot-bracket notation
<i>pr</i>	The probability for each base pair used in the plist

##### Returns

The plist array

#### 17.59.4.27 vrna\_db\_from\_plist()

```
char* vrna_db_from_plist (
    vrna_ep_t * pairs,
    unsigned int n )

#include <ViennaRNA/structure_utils.h>
```

Convert a list of base pairs into dot-bracket notation.

##### See also

[vrna\\_plist\(\)](#)

##### Parameters

<i>pairs</i>	A <code>vrna_ep_t</code> containing the pairs to be included in the dot-bracket string
<i>n</i>	The length of the structure (number of nucleotides)

##### Returns

The dot-bracket string containing the provided base pairs

17.59.4.28 `assign_plist_from_db()`

```
void assign_plist_from_db (
    vrna_ep_t ** pl,
    const char * struc,
    float pr )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a `vrna_ep_t` from a dot-bracket string.

The dot-bracket string is parsed and for each base pair an entry in the plist is created. The probability of each pair in the list is set by a function parameter.

The end of the plist is marked by sequence positions *i* as well as *j* equal to 0. This condition should be used to stop looping over its entries

**Deprecated** Use `vrna_plist()` instead

## Parameters

<i>pl</i>	A pointer to the <code>vrna_ep_t</code> that is to be created
<i>struc</i>	The secondary structure in dot-bracket notation
<i>pr</i>	The probability for each base pair

17.59.4.29 `pack_structure()`

```
char* pack_structure (
    const char * struc )
```

```
#include <ViennaRNA/structure_utils.h>
```

Pack secondary secondary structure, 5:1 compression using base 3 encoding.

Returns a binary string encoding of the secondary structure using a 5:1 compression scheme. The string is NULL terminated and can therefore be used with standard string functions such as `strcmp()`. Useful for programs that need to keep many structures in memory.

**Deprecated** Use `vrna_db_pack()` as a replacement

## Parameters

<i>struc</i>	The secondary structure in dot-bracket notation
--------------	---

## Returns

The binary encoded structure

### 17.59.4.30 unpack\_structure()

```
char* unpack_structure (
    const char * packed )
```

```
#include <ViennaRNA/structure_utils.h>
```

Unpack secondary structure previously packed with [pack\\_structure\(\)](#)

Translate a compressed binary string produced by [pack\\_structure\(\)](#) back into the familiar dot-bracket notation.

**Deprecated** Use [vrna\\_db\\_unpack\(\)](#) as a replacement

#### Parameters

<i>packed</i>	The binary encoded packed secondary structure
---------------	---

#### Returns

The unpacked secondary structure in dot-bracket notation

### 17.59.4.31 make\_pair\_table()

```
short* make_pair_table (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a pair table of a secondary structure.

Returns a newly allocated table, such that table[i]=j if (i,j) pair or 0 if i is unpaired, table[0] contains the length of the structure.

**Deprecated** Use [vrna\\_ptable\(\)](#) instead

#### Parameters

<i>structure</i>	The secondary structure in dot-bracket notation
------------------	---

#### Returns

A pointer to the created pair\_table

17.59.4.32 `copy_pair_table()`

```
short* copy_pair_table (
    const short * pt )
```

```
#include <ViennaRNA/structure_utils.h>
```

Get an exact copy of a pair table.

**Deprecated** Use `vrna_ptable_copy()` instead

**Parameters**

<i>pt</i>	The pair table to be copied
-----------	-----------------------------

**Returns**

A pointer to the copy of 'pt'

17.59.4.33 `alimake_pair_table()`

```
short* alimake_pair_table (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

Pair table for snoop align

**Deprecated** Use `vrna_pt_ali_get()` instead!

17.59.4.34 `make_pair_table_snoop()`

```
short* make_pair_table_snoop (
    const char * structure )
```

```
#include <ViennaRNA/structure_utils.h>
```

returns a newly allocated table, such that: `table[i]=j` if (i,j) pair or 0 if i is unpaired, `table[0]` contains the length of the structure. The special pseudoknotted H/ACA-mRNA structure is taken into account.

**Deprecated** Use `vrna_pt_snoop_get()` instead!

#### 17.59.4.35 bp\_distance()

```
int bp_distance (
    const char * str1,
    const char * str2 )

#include <ViennaRNA/structure_utils.h>
```

Compute the "base pair" distance between two secondary structures s1 and s2.

The sequences should have the same length. dist = number of base pairs in one structure but not in the other same as edit distance with open-pair close-pair as move-set

**Deprecated** Use vrna\_bp\_distance instead

##### Parameters

<i>str1</i>	First structure in dot-bracket notation
<i>str2</i>	Second structure in dot-bracket notation

##### Returns

The base pair distance between str1 and str2

#### 17.59.4.36 make\_referenceBP\_array()

```
unsigned int* make_referenceBP_array (
    short * reference_pt,
    unsigned int turn )

#include <ViennaRNA/structure_utils.h>
```

Make a reference base pair count matrix.

Get an upper triangular matrix containing the number of basepairs of a reference structure for each interval [i,j] with i<j. Access it via indx!!!

**Deprecated** Use vrna\_refBPcnt\_matrix() instead

**17.59.4.37 compute\_BPdifferences()**

```
unsigned int* compute_BPdifferences (
    short * pt1,
    short * pt2,
    unsigned int turn )

#include <ViennaRNA/structure_utils.h>
```

Make a reference base pair distance matrix.

Get an upper triangular matrix containing the base pair distance of two reference structures for each interval [i,j] with i<j. Access it via iindx!!!

**Deprecated** Use `vrna_refBPdist_matrix()` instead

**17.59.4.38 parenthesis\_structure()**

```
void parenthesis_structure (
    char * structure,
    vrna_bp_stack_t * bp,
    int length )

#include <ViennaRNA/structure_utils.h>
```

Create a dot-bracket/parenthesis structure from backtracking stack.

**Deprecated** use `vrna_parenthesis_structure()` instead

**Note**

This function is threadsafe

**17.59.4.39 parenthesis\_zuker()**

```
void parenthesis_zuker (
    char * structure,
    vrna_bp_stack_t * bp,
    int length )

#include <ViennaRNA/structure_utils.h>
```

Create a dot-bracket/parenthesis structure from backtracking stack obtained by zuker suboptimal calculation in `cofold.c`.

**Deprecated** use `vrna_parenthesis_zuker` instead

**Note**

This function is threadsafe

#### 17.59.4.40 `bppm_to_structure()`

```
void bppm_to_structure (
    char * structure,
    FLT_OR_DBL * pr,
    unsigned int length )
```

```
#include <ViennaRNA/structure_utils.h>
```

Create a dot-bracket like structure string from base pair probability matrix.

**Deprecated** Use `vrna_db_from_probs()` instead!

#### 17.59.4.41 `bppm_symbol()`

```
char bppm_symbol (
    const float * x )
```

```
#include <ViennaRNA/structure_utils.h>
```

Get a pseudo dot bracket notation for a given probability information.

**Deprecated** Use `vrna_bpp_symbol()` instead!

### 17.60.1 Detailed Description

### 17.60.2 Data Structure Documentation

#### 17.60.2.1 struct vrna\_pinfo\_s

A base pair info structure.

For each base pair (i,j) with i,j in [0, n-1] the structure lists:

- its probability 'p'
- an entropy-like measure for its well-definedness 'ent'
- the frequency of each type of pair in 'bp[]'
  - 'bp[0]' contains the number of non-compatible sequences
  - 'bp[1]' the number of CG pairs, etc.

#### Data Fields

- unsigned `i`  
*nucleotide position i*
- unsigned `j`  
*nucleotide position j*
- float `p`  
*Probability.*
- float `ent`  
*Pseudo entropy for  $p(i, j) = S_i + S_j - p_{ij} * \ln(p_{ij})$ .*
- short `bp` [8]  
*Frequencies of pair\_types.*
- char `comp`  
*1 iff pair is in mfe structure*

### 17.60.3 Macro Definition Documentation

#### 17.60.3.1 VRNA\_MEASURE\_SHANNON\_ENTROPY

```
#define VRNA_MEASURE_SHANNON_ENTROPY 1U

#include <ViennaRNA/aln_util.h>
```

Flag indicating Shannon Entropy measure.

Shannon Entropy is defined as  $H = - \sum_c p_c \cdot \log_2 p_c$

## 17.60.4 Typedef Documentation

### 17.60.4.1 pair\_info

```
typedef struct vrna_pinfo_s pair_info

#include <ViennaRNA/aln_util.h>
```

Old typename of `vrna_pinfo_s`.

**Deprecated** Use `vrna_pinfo_t` instead!

## 17.60.5 Function Documentation

### 17.60.5.1 vrna\_aln\_mpi()

```
int vrna_aln_mpi (
    const char ** alignment )

#include <ViennaRNA/aln_util.h>
```

Get the mean pairwise identity in steps from ?to?(ident)

#### Parameters

<i>alignment</i>	Aligned sequences
------------------	-------------------

#### Returns

The mean pairwise identity

### 17.60.5.2 vrna\_aln\_pinfo()

```
vrna_pinfo_t* vrna_aln_pinfo (
    vrna_fold_compound_t * vc,
    const char * structure,
    double threshold )

#include <ViennaRNA/aln_util.h>
```

Retrieve an array of `vrna_pinfo_t` structures from precomputed pair probabilities.

This array of structures contains information about positionwise pair probabilities, base pair entropy and more

See also

[vrna\\_pinfo\\_t](#), and [vrna\\_pf\(\)](#)

#### Parameters

<i>vc</i>	The <a href="#">vrna_fold_compound_t</a> of type <a href="#">VRNA_FC_TYPE_COMPARATIVE</a> with precomputed partition function matrices
<i>structure</i>	An optional structure in dot-bracket notation (Maybe NULL)
<i>threshold</i>	Do not include results with pair probabilities below threshold

#### Returns

The [vrna\\_pinfo\\_t](#) array

#### 17.60.5.3 vrna\_aln\_slice()

```
char** vrna_aln_slice (
    const char ** alignment,
    unsigned int i,
    unsigned int j )
```

```
#include <ViennaRNA/aln\_util.h>
```

Slice out a subalignment from a larger alignment.

#### Note

The user is responsible to free the memory occupied by the returned subalignment

See also

[vrna\\_aln\\_free\(\)](#)

#### Parameters

<i>alignment</i>	The input alignment
<i>i</i>	The first column of the subalignment (1-based)
<i>j</i>	The last column of the subalignment (1-based)

#### Returns

The subalignment between column *i* and *j*

#### 17.60.5.4 `vrna_aln_free()`

```
void vrna_aln_free (
    char ** alignment )
```

```
#include <ViennaRNA/aln_util.h>
```

Free memory occupied by a set of aligned sequences.

##### Parameters

<i>alignment</i>	The input alignment
------------------	---------------------

#### 17.60.5.5 `vrna_aln_uppercase()`

```
char** vrna_aln_uppercase (
    const char ** alignment )
```

```
#include <ViennaRNA/aln_util.h>
```

Create a copy of an alignment with only uppercase letters in the sequences.

##### See also

[vrna\\_aln\\_copy](#)

##### Parameters

<i>alignment</i>	The input sequence alignment (last entry must be <i>NULL</i> terminated)
------------------	--

##### Returns

A copy of the input alignment where lowercase sequence letters are replaced by uppercase letters

#### 17.60.5.6 `vrna_aln_toRNA()`

```
char** vrna_aln_toRNA (
    const char ** alignment )
```

```
#include <ViennaRNA/aln_util.h>
```

Create a copy of an alignment where DNA alphabet is replaced by RNA alphabet.

##### See also

[vrna\\_aln\\_copy](#)

**Parameters**

<i>alignment</i>	The input sequence alignment (last entry must be <i>NULL</i> terminated)
------------------	--

**Returns**

A copy of the input alignment where DNA alphabet is replaced by RNA alphabet (T -> U)

**17.60.5.7 vrna\_aln\_copy()**

```
char** vrna_aln_copy (
    const char ** alignment,
    unsigned int options )
```

```
#include <ViennaRNA/aln_util.h>
```

Make a copy of a multiple sequence alignment.

This function allows one to create a copy of a multiple sequence alignment. The `options` parameter additionally allows for sequence manipulation, such as converting DNA to RNA alphabet, and conversion to uppercase letters.

**See also**

[vrna\\_aln\\_copy\(\)](#), `#VRNA_ALN_RNA`, `#VRNA_ALN_UPPERCASE`, `#VRNA_ALN_DEFAULT`

**Parameters**

<i>alignment</i>	The input sequence alignment (last entry must be <i>NULL</i> terminated)
<i>options</i>	Option flags indicating whether the aligned sequences should be converted

**Returns**

A (manipulated) copy of the input alignment

**17.60.5.8 vrna\_aln\_conservation\_struct()**

```
float * vrna_aln_conservation_struct (
    const char ** alignment,
    const char * structure,
    const vrna_md_t * md )
```

```
#include <ViennaRNA/aln_util.h>
```

Compute base pair conservation of a consensus structure.

This function computes the base pair conservation (fraction of canonical base pairs) of a consensus structure given a multiple sequence alignment. The base pair types that are considered canonical may be specified using the `#vrna_md_t.pairs` array. Passing *NULL* as parameter `md` results in default pairing rules, i.e. canonical Watson-Crick and GU Wobble pairs.

## Parameters

<i>alignment</i>	The input sequence alignment (last entry must be <i>NULL</i> terminated)
<i>structure</i>	The consensus structure in dot-bracket notation
<i>md</i>	Model details that specify compatible base pairs (Maybe <i>NULL</i> )

## Returns

A 1-based vector of base pair conservations

**SWIG Wrapper Notes** This function is available in an overloaded form where the last parameter may be omitted, indicating `md = NULL`

17.60.5.9 `vrna_aln_conservation_col()`

```
float * vrna_aln_conservation_col (
    const char ** alignment,
    const vrna_md_t * md,
    unsigned int options )
```

```
#include <ViennaRNA/aln_util.h>
```

Compute nucleotide conservation in an alignment.

This function computes the conservation of nucleotides in alignment columns. The simplest measure is Shannon Entropy and can be selected by passing the `VRNA_MEASURE_SHANNON_ENTROPY` flag in the `options` parameter.

## Note

Currently, only `VRNA_MEASURE_SHANNON_ENTROPY` is supported as conservation measure.

## See also

`VRNA_MEASURE_SHANNON_ENTROPY`

## Parameters

<i>alignment</i>	The input sequence alignment (last entry must be <i>NULL</i> terminated)
<i>md</i>	Model details that specify known nucleotides (Maybe <i>NULL</i> )
<i>options</i>	A flag indicating which measure of conservation should be applied

## Returns

A 1-based vector of column conservations

**SWIG Wrapper Notes** This function is available in an overloaded form where the last two parameters may be omitted, indicating `md = NULL`, and `options = VRNA_MEASURE_SHANNON_ENTROPY`,

respectively.

#### 17.60.5.10 `get_mpi()`

```
int get_mpi (
    char * Alseq[],
    int n_seq,
    int length,
    int * mini )
```

```
#include <ViennaRNA/aln_util.h>
```

Get the mean pairwise identity in steps from ?to?(ident)

**Deprecated** Use `vrna_aln_mpi()` as a replacement

##### Parameters

<i>Alseq</i>	
<i>n_seq</i>	The number of sequences in the alignment
<i>length</i>	The length of the alignment
<i>mini</i>	

##### Returns

The mean pairwise identity

#### 17.60.5.11 `encode_ali_sequence()`

```
void encode_ali_sequence (
    const char * sequence,
    short * S,
    short * s5,
    short * s3,
    char * ss,
    unsigned short * as,
    int circ )
```

```
#include <ViennaRNA/aln_util.h>
```

Get arrays with encoded sequence of the alignment.

this function assumes that in *S*, *S5*, *s3*, *ss* and *as* enough space is already allocated (size must be at least `sequence length+2`)

## Parameters

<i>sequence</i>	The gapped sequence from the alignment
<i>S</i>	pointer to an array that holds encoded sequence
<i>s5</i>	pointer to an array that holds the next base 5' of alignment position i
<i>s3</i>	pointer to an array that holds the next base 3' of alignment position i
<i>ss</i>	
<i>as</i>	
<i>circ</i>	assume the molecules to be circular instead of linear (circ=0)

17.60.5.12 `alloc_sequence_arrays()`

```
void alloc_sequence_arrays (
    const char ** sequences,
    short *** S,
    short *** S5,
    short *** S3,
    unsigned short *** a2s,
    char *** Ss,
    int circ )
```

```
#include <ViennaRNA/aln_util.h>
```

Allocate memory for sequence array used to deal with aligned sequences.

Note that these arrays will also be initialized according to the sequence alignment given

## See also

[free\\_sequence\\_arrays\(\)](#)

## Parameters

<i>sequences</i>	The aligned sequences
<i>S</i>	A pointer to the array of encoded sequences
<i>S5</i>	A pointer to the array that contains the next 5' nucleotide of a sequence position
<i>S3</i>	A pointer to the array that contains the next 3' nucleotide of a sequence position
<i>a2s</i>	A pointer to the array that contains the alignment to sequence position mapping
<i>Ss</i>	A pointer to the array that contains the ungapped sequence
<i>circ</i>	assume the molecules to be circular instead of linear (circ=0)

17.60.5.13 `free_sequence_arrays()`

```
void free_sequence_arrays (
    unsigned int n_seq,
```

```
short *** S,  
short *** S5,  
short *** S3,  
unsigned short *** a2s,  
char *** Ss )
```

```
#include <ViennaRNA/aln_util.h>
```

Free the memory of the sequence arrays used to deal with aligned sequences.

This function frees the memory previously allocated with [alloc\\_sequence\\_arrays\(\)](#)

See also

[alloc\\_sequence\\_arrays\(\)](#)

#### Parameters

<i>n_seq</i>	The number of aligned sequences
<i>S</i>	A pointer to the array of encoded sequences
<i>S5</i>	A pointer to the array that contains the next 5' nucleotide of a sequence position
<i>S3</i>	A pointer to the array that contains the next 3' nucleotide of a sequence position
<i>a2s</i>	A pointer to the array that contains the alignment to sequence position mapping
<i>Ss</i>	A pointer to the array that contains the ungapped sequence

## 17.61.4 Function Documentation

## 17.61.4.1 vrna\_file\_commands\_read()

```
vrna_cmd_t* vrna_file_commands_read (
    const char * filename,
    unsigned int options )

#include <ViennaRNA/commands.h>
```

Extract a list of commands from a command file.

Read a list of commands specified in the input file and return them as list of abstract commands

See also

[vrna\\_commands\\_apply\(\)](#), [vrna\\_file\\_commands\\_apply\(\)](#), [vrna\\_commands\\_free\(\)](#)

Parameters

<i>filename</i>	The filename
<i>options</i>	Options to limit the type of commands read from the file

Returns

A list of abstract commands

## 17.61.4.2 vrna\_file\_commands\_apply()

```
int vrna_file_commands_apply (
    vrna_fold_compound_t * vc,
```

```
const char * filename,
unsigned int options )
```

```
#include <ViennaRNA/commands.h>
```

Apply a list of commands from a command file.

This function is a shortcut to directly parse a commands file and apply all successfully parsed commands to a `vrna_fold_compound_t` data structure. It is the same as:

```
int          r;
vrna_cmd_t   *cmds;

cmds = vrna_file_commands_read(filename, options);
r     = vrna_commands_apply(vc, cmds, options);

vrna_commands_free(cmds);

return r;
```

#### Parameters

<code>vc</code>	The <code>vrna_fold_compound_t</code> the command list will be applied to
<code>filename</code>	The filename
<code>options</code>	Options to limit the type of commands read from the file

#### Returns

The number of commands successfully applied

**SWIG Wrapper Notes** This function is attached as method `file_commands_apply()` to objects of type `fold_compound`

#### 17.61.4.3 vrna\_commands\_apply()

```
int vrna_commands_apply (
    vrna_fold_compound_t * vc,
    vrna_cmd_t * commands,
    unsigned int options )
```

```
#include <ViennaRNA/commands.h>
```

Apply a list of commands to a `vrna_fold_compound_t`.

#### Parameters

<code>vc</code>	The <code>vrna_fold_compound_t</code> the command list will be applied to
<code>commands</code>	The list of commands to apply
<code>options</code>	Options to limit the type of commands read from the file

**Returns**

The number of commands successfully applied

**SWIG Wrapper Notes** This function is attached as method **commands\_apply()** to objects of type *fold\_compound*

**17.61.4.4 vrna\_commands\_free()**

```
void vrna_commands_free (
    vrna_cmd_t * commands )
```

```
#include <ViennaRNA/commands.h>
```

Free memory occupied by a list of commands.

Release memory occupied by a list of commands

**Parameters**

<i>commands</i>	A pointer to a list of commands
-----------------	---------------------------------

**17.61.4.5 vrna\_file\_helixlist()**

```
void vrna_file_helixlist (
    const char * seq,
    const char * db,
    float energy,
    FILE * file )
```

```
#include <ViennaRNA/file_formats.h>
```

Print a secondary structure as helix list.

**Parameters**

<i>seq</i>	The RNA sequence
<i>db</i>	The structure in dot-bracket format
<i>energy</i>	Free energy of the structure in kcal/mol
<i>file</i>	The file handle used to print to (print defaults to 'stdout' if(file == NULL) )

**17.61.4.6 vrna\_file\_connect()**

```
void vrna_file_connect (
    const char * seq,
```

```

    const char * db,
    float energy,
    const char * identifier,
    FILE * file )

```

```
#include <ViennaRNA/file_formats.h>
```

Print a secondary structure as connect table.

Connect table file format looks like this:

```

300 ENERGY = 7.0 example
  1 G      0   2  22   1
  2 G      1   3  21   2

```

where the headerline is followed by 6 columns with:

1. Base number: index n
2. Base (A, C, G, T, U, X)
3. Index n-1 (0 if first nucleotide)
4. Index n+1 (0 if last nucleotide)
5. Number of the base to which n is paired. No pairing is indicated by 0 (zero).
6. Natural numbering.

#### Parameters

<i>seq</i>	The RNA sequence
<i>db</i>	The structure in dot-bracket format
<i>energy</i>	The free energy of the structure
<i>identifier</i>	An optional identifier for the sequence
<i>file</i>	The file handle used to print to (print defaults to 'stdout' if(file == NULL) )

#### 17.61.4.7 vrna\_file\_bpseq()

```

void vrna_file_bpseq (
    const char * seq,
    const char * db,
    FILE * file )

```

```
#include <ViennaRNA/file_formats.h>
```

Print a secondary structure in bpseq format.

#### Parameters

<i>seq</i>	The RNA sequence
<i>db</i>	The structure in dot-bracket format
<i>file</i>	The file handle used to print to (print defaults to 'stdout' if(file == NULL) )

17.61.4.8 `vrna_file_json()`

```
void vrna_file_json (
    const char * seq,
    const char * db,
    double energy,
    const char * identifier,
    FILE * file )

#include <ViennaRNA/file_formats.h>
```

Print a secondary structure in jsonformat.

## Parameters

<i>seq</i>	The RNA sequence
<i>db</i>	The structure in dot-bracket format
<i>energy</i>	The free energy
<i>identifier</i>	An identifier for the sequence
<i>file</i>	The file handle used to print to (print defaults to 'stdout' if(file == NULL) )

17.61.4.9 `vrna_file_fasta_read_record()`

```
unsigned int vrna_file_fasta_read_record (
    char ** header,
    char ** sequence,
    char *** rest,
    FILE * file,
    unsigned int options )

#include <ViennaRNA/file_formats.h>
```

Get a (fasta) data set from a file or stdin.

This function may be used to obtain complete datasets from a filehandle or stdin. A dataset is always defined to contain at least a sequence. If data starts with a fasta header, i.e. a line like

```
>some header info
```

then `vrna_file_fasta_read_record()` will assume that the sequence that follows the header may span over several lines. To disable this behavior and to assign a single line to the argument 'sequence' one can pass `VRNA_INPUT_NO_SPAN` in the 'options' argument. If no fasta header is read in the beginning of a data block, a sequence must not span over multiple lines!

Unless the options `VRNA_INPUT_NOSKIP_COMMENTS` or `VRNA_INPUT_NOSKIP_BLANK_LINES` are passed, a sequence may be interrupted by lines starting with a comment character or empty lines.

A sequence is regarded as completely read if it was either assumed to not span over multiple lines, a secondary structure or structure constraint follows the sequence on the next line, or a new header marks the beginning of a new sequence...

All lines following the sequence (this includes comments) that do not initiate a new dataset according to the above definition are available through the line-array 'rest'. Here one can usually find the structure constraint or other information belonging to the current dataset. Filling of 'rest' may be prevented by passing `VRNA_INPUT_NO_REST` to the options argument.

**Note**

This function will exit any program with an error message if no sequence could be read!  
 This function is NOT threadsafe! It uses a global variable to store information about the next data block.

The main purpose of this function is to be able to easily parse blocks of data in the header of a loop where all calculations for the appropriate data is done inside the loop. The loop may be then left on certain return values, e.g.:

```
char *id, *seq, **rest;
int i;
id = seq = NULL;
rest = NULL;
while(!(vrna_file_fasta_read_record(&id, &seq, &rest, NULL, 0) & (
    VRNA_INPUT_ERROR | VRNA_INPUT_QUIT))){
    if(id) printf("%s\n", id);
    printf("%s\n", seq);
    if(rest)
        for(i=0;rest[i];i++){
            printf("%s\n", rest[i]);
            free(rest[i]);
        }
    free(rest);
    free(seq);
    free(id);
}
```

In the example above, the while loop will be terminated when `vrna_file_fasta_read_record()` returns either an error, EOF, or a user initiated quit request.

As long as data is read from stdin (we are passing NULL as the file pointer), the id is printed if it is available for the current block of data. The sequence will be printed in any case and if some more lines belong to the current block of data each line will be printed as well.

**Note**

Do not forget to free the memory occupied by header, sequence and rest!

**Parameters**

<i>header</i>	A pointer which will be set such that it points to the header of the record
<i>sequence</i>	A pointer which will be set such that it points to the sequence of the record
<i>rest</i>	A pointer which will be set such that it points to an array of lines which also belong to the record
<i>file</i>	A file handle to read from (if NULL, this function reads from stdin)
<i>options</i>	Some options which may be passed to alter the behavior of the function, use 0 for no options

**Returns**

A flag with information about what the function actually did read

**17.61.4.10 vrna\_extract\_record\_rest\_structure()**

```
char* vrna_extract_record_rest_structure (
    const char ** lines,
    unsigned int length,
    unsigned int option )
```

```
#include <ViennaRNA/file_formats.h>
```

Extract a dot-bracket structure string from (multiline)character array.

This function extracts a dot-bracket structure string from the 'rest' array as returned by [vrna\\_file\\_fasta\\_read\\_record\(\)](#) and returns it. All occurrences of comments within the 'lines' array will be skipped as long as they do not break the structure string. If no structure could be read, this function returns NULL.

#### Precondition

The argument 'lines' has to be a 2-dimensional character array as obtained by [vrna\\_file\\_fasta\\_read\\_record\(\)](#)

#### See also

[vrna\\_file\\_fasta\\_read\\_record\(\)](#)

#### Parameters

<i>lines</i>	The (multiline) character array to be parsed
<i>length</i>	The assumed length of the dot-bracket string (passing a value < 1 results in no length limit)
<i>option</i>	Some options which may be passed to alter the behavior of the function, use 0 for no options

#### Returns

The dot-bracket string read from lines or NULL

#### 17.61.4.11 vrna\_file\_SHAPE\_read()

```
int vrna_file_SHAPE_read (
    const char * file_name,
    int length,
    double default_value,
    char * sequence,
    double * values )
```

```
#include <ViennaRNA/file_formats.h>
```

Read data from a given SHAPE reactivity input file.

This function parses the informations from a given file and stores the result in the preallocated string sequence and the double array values.

#### Parameters

<i>file_name</i>	Path to the constraints file
<i>length</i>	Length of the sequence (file entries exceeding this limit will cause an error)
<i>default_value</i>	Value for missing indices
<i>sequence</i>	Pointer to an array used for storing the sequence obtained from the SHAPE reactivity file
<i>values</i>	Pointer to an array used for storing the values obtained from the SHAPE reactivity file

#### 17.61.4.12 `vrna_extract_record_rest_constraint()`

```
void vrna_extract_record_rest_constraint (
    char ** cstruc,
    const char ** lines,
    unsigned int option )

#include <ViennaRNA/file_formats.h>
```

Extract a hard constraint encoded as pseudo dot-bracket string.

**Deprecated** Use `vrna_extract_record_rest_structure()` instead!

#### Precondition

The argument 'lines' has to be a 2-dimensional character array as obtained by `vrna_file_fasta_read_record()`

#### Parameters

<i>cstruc</i>	A pointer to a character array that is used as pseudo dot-bracket output
<i>lines</i>	A 2-dimensional character array with the extension lines from the FASTA input
<i>option</i>	The option flags that define the behavior and recognition pattern of this function

#### 17.61.4.13 `read_record()`

```
unsigned int read_record (
    char ** header,
    char ** sequence,
    char *** rest,
    unsigned int options )

#include <ViennaRNA/file_formats.h>
```

Get a data record from stdin.

**Deprecated** This function is deprecated! Use `vrna_file_fasta_read_record()` as a replacment.

17.61.4.14 `vrna_file_msa_read()`

```
vrna_file_msa_read (
    const char * filename,
    char *** names,
    char *** aln,
    char ** id,
    char ** structure,
    unsigned int options )

#include <ViennaRNA/file_formats_msa.h>
```

Read a multiple sequence alignment from file.

This function reads the (first) multiple sequence alignment from an input file. The read alignment is split into the sequence id/name part and the actual sequence information and stored in memory as arrays of ids/names and sequences. If the alignment file format allows for additional information, such as an ID of the entire alignment or consensus structure information, this data is retrieved as well and made available. The `options` parameter allows to specify the set of alignment file formats that should be used to retrieve the data. If 0 is passed as option, the list of alignment file formats defaults to `VRNA_FILE_FORMAT_MSA_DEFAULT`.

Currently, the list of parsable multiple sequence alignment file formats consists of:

- [ClustalW format](#)
- [Stockholm 1.0 format](#)
- [FASTA \(Pearson\) format](#)
- [MAF format](#)

**Note**

After successfully reading an alignment, this function performs a validation of the data that includes uniqueness of the sequence identifiers, and equal sequence lengths. This check can be deactivated by passing `VRNA_FILE_FORMAT_MSA_NOCHECK` in the `options` parameter.

It is the users responsibility to free any memory occupied by the output arguments `names`, `aln`, `id`, and `structure` after calling this function. The function automatically sets the latter two arguments to `NULL` in case no corresponding data could be retrieved from the input alignment.

**See also**

**Parameters**

<i>filename</i>	The name of input file that contains the alignment
<i>names</i>	An address to the pointer where sequence identifiers should be written to
<i>aln</i>	An address to the pointer where aligned sequences should be written to
<i>id</i>	An address to the pointer where the alignment ID should be written to (Maybe NULL)
<i>structure</i>	An address to the pointer where consensus structure information should be written to (Maybe NULL)
<i>options</i>	Options to manipulate the behavior of this function

**Returns**

The number of sequences in the alignment, or -1 if no alignment record could be found

**SWIG Wrapper Notes** In the target scripting language, only the first and last argument, `filename` and `options`, are passed to the corresponding function. The other arguments, which serve as output in the C-library, are available as additional return values. Hence, a function call in python may look like this:

```
num_seq, names, aln, id, structure = RNA.file_msa_read("msa.stk", RNA.FILE_FORMAT_MSA_STOCKHOLM)
```

After successfully reading the first record, the variable `num_seq` contains the number of sequences in the alignment (the actual return value of the C-function), while the variables `names`, `aln`, `id`, and `structure` are lists of the sequence names and aligned sequences, as well as strings holding the alignment ID and the structure as stated in the `SS_cons` line, respectively. Note, the last two return values may be empty strings in case the alignment does not provide the required data.

This function exists as an overloaded version where the `options` parameter may be omitted! In that case, the `options` parameter defaults to [VRNA\\_FILE\\_FORMAT\\_MSA\\_STOCKHOLM](#).

**17.61.4.15 vrna\_file\_msa\_read\_record()**

```
vrna_file_msa_read_record (
    FILE * fp,
    char *** names,
    char *** aln,
    char ** id,
    char ** structure,
    unsigned int options )

#include <ViennaRNA/file_formats_msa.h>
```

Read a multiple sequence alignment from file handle.

Similar to [vrna\\_file\\_msa\\_read\(\)](#), this function reads a multiple sequence alignment from an input file handle. Since using a file handle, this function is not limited to the first alignment record, but allows for looping over all alignments within the input.

The read alignment is split into the sequence id/name part and the actual sequence information and stored in memory as arrays of ids/names and sequences. If the alignment file format allows for additional information, such as an ID of the entire alignment or consensus structure information, this data is retrieved as well and made available. The `options` parameter allows to specify the alignment file format used to retrieve the data. A single format must be specified here, see [vrna\\_file\\_msa\\_detect\\_format\(\)](#) for helping to determine the correct MSA file format.

Currently, the list of parsable multiple sequence alignment file formats consists of:

- [ClustalW format](#)
- [Stockholm 1.0 format](#)
- [FASTA \(Pearson\) format](#)
- [MAF format](#)

**Note**

After successfully reading an alignment, this function performs a validation of the data that includes uniqueness of the sequence identifiers, and equal sequence lengths. This check can be deactivated by passing `VRNA_FILE_FORMAT_MSA_NOCHECK` in the `options` parameter.

It is the users responsibility to free any memory occupied by the output arguments `names`, `aln`, `id`, and `structure` after calling this function. The function automatically sets the latter two arguments to `NULL` in case no corresponding data could be retrieved from the input alignment.

**Parameters**

<i>fp</i>	The file pointer the data will be retrieved from
<i>names</i>	An address to the pointer where sequence identifiers should be written to
<i>aln</i>	An address to the pointer where aligned sequences should be written to
<i>id</i>	An address to the pointer where the alignment ID should be written to (Maybe NULL)
<i>structure</i>	An address to the pointer where consensus structure information should be written to (Maybe NULL)
<i>options</i>	Options to manipulate the behavior of this function

**Returns**

The number of sequences in the alignment, or -1 if no alignment record could be found

**SWIG Wrapper Notes** In the target scripting language, only the first and last argument, `fp` and `options`, are passed to the corresponding function. The other arguments, which serve as output in the C-library, are available as additional return values. Hence, a function call in python may look like this:

```
f = open('msa.stk', 'r')
num_seq, names, aln, id, structure = RNA.file_msa_read_record(f, RNA.FILE_FORMAT_MSA_STOCKHOLM)
f.close()
```

After successfully reading the first record, the variable `num_seq` contains the number of sequences in the alignment (the actual return value of the C-function), while the variables `names`, `aln`, `id`, and `structure` are lists of the sequence names and aligned sequences, as well as strings holding the alignment ID and the structure as stated in the `SS_cons` line, respectively. Note, the last two return values may be empty strings in case the alignment does not provide the required data.

This function exists as an overloaded version where the `options` parameter may be omitted! In that case, the `options` parameter defaults to `VRNA_FILE_FORMAT_MSA_STOCKHOLM`.

**17.61.4.16 vrna\_file\_msa\_detect\_format()**

```
vrna_file_msa_detect_format (
    const char * fn,
    unsigned int options )
```

```
#include <ViennaRNA/file_formats_msa.h>
```

Detect the format of a multiple sequence alignment file.

This function attempts to determine the format of a file that supposedly contains a multiple sequence alignment (MSA). This is useful in cases where a MSA file contains more than a single record and therefore [vrna\\_file\\_msa\\_read\(\)](#) can not be applied, since it only retrieves the first. Here, one can try to guess the correct file format using this function and then loop over the file, record by record using one of the low-level record retrieval functions for the corresponding MSA file format.

#### Note

This function parses the entire first record within the specified file. As a result, it returns [VRNA\\_FILE\\_FORMAT\\_MSA\\_UNKNOWN](#) not only if it can't detect the file's format, but also in cases where the file doesn't contain sequences!

#### Parameters

<i>filename</i>	The name of input file that contains the alignment
<i>options</i>	Options to manipulate the behavior of this function

#### Returns

The MSA file format, or [VRNA\\_FILE\\_FORMAT\\_MSA\\_UNKNOWN](#)

**SWIG Wrapper Notes** This function exists as an overloaded version where the `options` parameter may be omitted! In that case, the `options` parameter defaults to [VRNA\\_FILE\\_FORMAT\\_MSA\\_DEFAULT](#).

#### 17.61.4.17 vrna\_file\_msa\_write()

```
vrna_file_msa_write (
    const char * filename,
    const char ** names,
    const char ** aln,
    const char * id,
    const char * structure,
    const char * source,
    unsigned int options )

#include <ViennaRNA/file_formats_msa.h>
```

Write multiple sequence alignment file.

#### Note

Currently, we only support [Stockholm 1.0 format](#) output

#### See also

[VRNA\\_FILE\\_FORMAT\\_MSA\\_STOCKHOLM](#), [VRNA\\_FILE\\_FORMAT\\_MSA\\_APPEND](#), [VRNA\\_FILE\\_FORMAT\\_MSA\\_MIS](#)

## Parameters

<i>filename</i>	The output filename
<i>names</i>	The array of sequence names / identifies
<i>aln</i>	The array of aligned sequences
<i>id</i>	An optional ID for the alignment
<i>structure</i>	An optional consensus structure
<i>source</i>	A string describing the source of the alignment
<i>options</i>	Options to manipulate the behavior of this function

## Returns

Non-null upon successfully writing the alignment to file

**SWIG Wrapper Notes** In the target scripting language, this function exists as a set of overloaded versions, where the last four parameters may be omitted. If the `options` parameter is missing the options default to (`VRNA_FILE_FORMAT_MSA_STOCKHOLM` | `VRNA_FILE_FORMAT_MSA_APPEND`).

17.61.4.18 `vrna_read_line()`

```
char* vrna_read_line (
    FILE * fp )
```

```
#include <ViennaRNA/file_utils.h>
```

Read a line of arbitrary length from a stream.

Returns a pointer to the resulting string. The necessary memory is allocated and should be released using `free()` when the string is no longer needed.

## Parameters

<i>fp</i>	A file pointer to the stream where the function should read from
-----------	--

## Returns

A pointer to the resulting string

17.61.4.19 `vrna_filename_sanitize()`

```
char* vrna_filename_sanitize (
    const char * name,
    const char * replacement )
```

```
#include <ViennaRNA/file_utils.h>
```

Sanitize a file name.

Returns a new file name where all invalid characters are substituted by a replacement character. If no replacement character is supplied, invalid characters are simply removed from the filename. File names may also never exceed a length of 255 characters. Longer file names will undergo a 'smart' truncation process, where the filenames' suffix, i.e. everything after the last dot '.', is attempted to be kept intact. Hence, only the filename part before the suffix is reduced in such a way that the total filename complies to the length restriction of 255 characters. If no suffix is present or the suffix itself already exceeds the maximum length, the filename is simply truncated from the back of the string.

For now we consider the following characters invalid:

- backslash '\'
- slash '/'
- question mark '?'
- percent sign %
- asterisk '\*'
- colon ':'
- pipe symbol '|'
- double quote ""
- triangular brackets '<' and '>'

Furthermore, the (resulting) file name must not be a reserved file name, such as:

- '.'
- '..'

#### Note

This function allocates a new block of memory for the sanitized string. It also may return (a) NULL if the input is pointing to NULL, or (b) an empty string if the input only consists of invalid characters which are simply removed!

#### Parameters

<i>name</i>	The input file name
<i>replacment</i>	The replacement character, or NULL

#### Returns

The sanitized file name, or NULL

## 17.62.4 Function Documentation

## 17.62.4.1 aliPS\_color\_aln()

```
int aliPS_color_aln (
    const char * structure,
    const char * filename,
    const char * seqs[],
    const char * names[] )
#include <ViennaRNA/plot_aln.h>
```

## 17.62.4.2 simple\_xy\_coordinates()

```
int simple_xy_coordinates (
    short * pair_table,
    float * X,
    float * Y )
#include <ViennaRNA/plot_layouts.h>

## Parameters

<i>pair_table</i>	The pair table of the secondary structure
<i>X</i>	a pointer to an array with enough allocated space to hold the x coordinates
<i>Y</i>	a pointer to an array with enough allocated space to hold the y coordinates

## Returns

length of sequence on success, 0 otherwise

## 17.62.4.3 simple\_circplot\_coordinates()

```
int simple_circplot_coordinates (
    short * pair_table,
    float * x,
    float * y )
```

```
#include <ViennaRNA/plot_layouts.h>
```

Calculate nucleotide coordinates for *Circular Plot*

This function calculates the coordinates of nucleotides mapped in equal distances onto a unit circle.

## Note

In order to draw nice arcs using quadratic bezier curves that connect base pairs one may calculate a second tangential point  $P^t$  in addition to the actual  $R^2$  coordinates. the simplest way to do so may be to compute a radius scaling factor  $rs$  in the interval  $[0, 1]$  that weights the proportion of base pair span to the actual length of the sequence. This scaling factor can then be used to calculate the coordinates for  $P^t$ , i.e.  $P_x^t[i] = X[i] * rs$  and  $P_y^t[i] = Y[i] * rs$ .

## See also

## Parameters

<i>pair_table</i>	The pair table of the secondary structure
<i>x</i>	a pointer to an array with enough allocated space to hold the x coordinates
<i>y</i>	a pointer to an array with enough allocated space to hold the y coordinates

## Returns

length of sequence on success, 0 otherwise

## 17.62.4.4 PS\_dot\_plot\_list()

```
int PS_dot_plot_list (
    char * seq,
    char * filename,
    plist * pl,
    plist * mf,
    char * comment )

#include <ViennaRNA/PS_dot.h>
```

Produce a postscript dot-plot from two pair lists.

This function reads two plist structures (e.g. base pair probabilities and a secondary structure) as produced by [assign\\_plist\\_from\\_pr\(\)](#) and [assign\\_plist\\_from\\_db\(\)](#) and produces a postscript "dot plot" that is written to 'filename'. Using base pair probabilities in the first and mfe structure in the second plist, the resulting "dot plot" represents each base pairing probability by a square of corresponding area in a upper triangle matrix. The lower part of the matrix contains the minimum free energy structure.

See also

[assign\\_plist\\_from\\_pr\(\)](#), [assign\\_plist\\_from\\_db\(\)](#)

## Parameters

<i>seq</i>	The RNA sequence
<i>filename</i>	A filename for the postscript output
<i>pl</i>	The base pair probability pairlist
<i>mf</i>	The mfe secondary structure pairlist
<i>comment</i>	A comment

## Returns

1 if postscript was successfully written, 0 otherwise

## 17.62.4.5 PS\_dot\_plot()

```
int PS_dot_plot (
    char * string,
    char * file )

#include <ViennaRNA/PS_dot.h>
```

Produce postscript dot-plot.

Wrapper to PS\_dot\_plot\_list

Reads base pair probabilities produced by [pf\\_fold\(\)](#) from the global array [pr](#) and the pair list [base\\_pair](#) produced by [fold\(\)](#) and produces a postscript "dot plot" that is written to 'filename'. The "dot plot" represents each base pairing probability by a square of corresponding area in a upper triangle matrix. The lower part of the matrix contains the minimum free energy

## Note

DO NOT USE THIS FUNCTION ANYMORE SINCE IT IS NOT THREADSAFE

**Deprecated** This function is deprecated and will be removed soon! Use [PS\\_dot\\_plot\\_list\(\)](#) instead!

### 17.62.5 Variable Documentation

#### 17.62.5.1 `rna_plot_type`

```
int rna_plot_type
```

```
#include <ViennaRNA/plot_layouts.h>
```

Switch for changing the secondary structure layout algorithm.

Current possibilities are 0 for a simple radial drawing or 1 for the modified radial drawing taken from the *naview* program of [3].

#### Note

To provide thread safety please do not rely on this global variable in future implementations but pass a plot type flag directly to the function that decides which layout algorithm it may use!

#### 19.4.1 Detailed Description

Partition function implementations for base pair distance classes.

## 19.4.2 Function Documentation

### 19.4.2.1 `get_TwoDpfold_variables()`

```
TwoDpfold_vars* get_TwoDpfold_variables (
    const char * seq,
    const char * structure1,
    char * structure2,
    int circ )
```

Get a datastructure containing all necessary attributes and global folding switches.

This function prepares all necessary attributes and matrices etc which are needed for a call of `TwoDpfold()`. A snapshot of all current global model switches (dangles, temperature and so on) is done and stored in the returned datastructure. Additionally, all matrices that will hold the partition function values are prepared.

**Deprecated** Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

#### Parameters

<i>seq</i>	the RNA sequence in uppercase format with letters from the alphabet {AUCG}
<i>structure1</i>	the first reference structure in dot-bracket notation
<i>structure2</i>	the second reference structure in dot-bracket notation
<i>circ</i>	a switch indicating if the sequence is linear (0) or circular (1)

#### Returns

the datastructure containing all necessary partition function attributes

### 19.4.2.2 `destroy_TwoDpfold_variables()`

```
void destroy_TwoDpfold_variables (
    TwoDpfold_vars * vars )
```

Free all memory occupied by a [TwoDpfold\\_vars](#) datastructure.

This function free's all memory occupied by a datastructure obtained from `get_TwoDpfold_variables()` or `get_TwoDpfold_variables_from_MFE()`

**Deprecated** Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

#### See also

[get\\_TwoDpfold\\_variables\(\)](#), [get\\_TwoDpfold\\_variables\\_from\\_MFE\(\)](#)

## Parameters

<i>vars</i>	the datastructure to be free'd
-------------	--------------------------------

## 19.4.2.3 TwoDpfoldList()

```
vrna_sol_TwoD_pf_t* TwoDpfoldList (
    TwoDpfold_vars * vars,
    int maxDistance1,
    int maxDistance2 )
```

Compute the partition function for all distance classes.

This function computes the partition functions for all distance classes according the two reference structures specified in the datastructure 'vars'. Similar to TwoDfold() the arguments maxDistance1 and maxDistance2 specify the maximum distance to both reference structures. A value of '-1' in either of them makes the appropriate distance restrictionless, i.e. all basepair distances to the reference are taken into account during computation. In case there is a restriction, the returned solution contains an entry where the attribute k=-1 contains the partition function for all structures exceeding the restriction. A values of **INF** in the attribute 'k' of the returned list denotes the end of the list

**Deprecated** Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions [vrna\\_fold\\_compound\\_TwoD\(\)](#), [vrna\\_pf\\_TwoD\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) instead!

## See also

[get\\_TwoDpfold\\_variables\(\)](#), [destroy\\_TwoDpfold\\_variables\(\)](#), [vrna\\_sol\\_TwoD\\_pf\\_t](#)

## Parameters

<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
<i>maxDistance1</i>	the maximum basepair distance to reference1 (may be -1)
<i>maxDistance2</i>	the maximum basepair distance to reference2 (may be -1)

## Returns

a list of partition funtions for the appropriate distance classes

## 19.4.2.4 TwoDpfold\_pbacktrack()

```
char* TwoDpfold_pbacktrack (
    TwoDpfold_vars * vars,
    int d1,
    int d2 )
```

Sample secondary structure representatives from a set of distance classes according to their Boltzmann probability.

If the argument 'd1' is set to '-1', the structure will be backtracked in the distance class where all structures exceeding the maximum basepair distance to either of the references reside.

#### Precondition

The argument 'vars' must contain precalculated partition function matrices, i.e. a call to `TwoDpfold()` preceding this function is mandatory!

**Deprecated** Use the new API that relies on [vrna\\_fold\\_compound\\_t](#) and the corresponding functions `vrna_fold_compound_TwoD()`, `vrna_pf_TwoD()`, `vrna_pbacktrack_TwoD()`, and `vrna_fold_compound_free()` instead!

#### See also

`TwoDpfold()`

#### Parameters

in	<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
in	<i>d1</i>	the distance to reference1 (may be -1)
in	<i>d2</i>	the distance to reference2

#### Returns

A sampled secondary structure in dot-bracket notation

#### 19.4.2.5 TwoDpfold\_pbacktrack5()

```
char* TwoDpfold_pbacktrack5 (
    TwoDpfold_vars * vars,
    int d1,
    int d2,
    unsigned int length )
```

Sample secondary structure representatives with a specified length from a set of distance classes according to their Boltzmann probability.

This function does essentially the same as [TwoDpfold\\_pbacktrack\(\)](#) with the only difference that partial structures, i.e. structures beginning from the 5' end with a specified length of the sequence, are backtracked

#### Note

This function does not work (since it makes no sense) for circular RNA sequences!

**Precondition**

The argument 'vars' must contain precalculated partition function matrices, i.e. a call to `TwoDpfold()` preceding this function is mandatory!

**Deprecated** Use the new API that relies on `vrna_fold_compound_t` and the corresponding functions `vrna_fold_compound_TwoD()`, `vrna_pf_TwoD()`, `vrna_pbacktrack5_TwoD()`, and `vrna_fold_compound_free()` instead!

**See also**

[TwoDpfold\\_pbacktrack\(\)](#), `TwoDpfold()`

**Parameters**

in	<i>vars</i>	the datastructure containing all necessary folding attributes and matrices
in	<i>d1</i>	the distance to reference1 (may be -1)
in	<i>d2</i>	the distance to reference2
in	<i>length</i>	the length of the structure beginning from the 5' end

**Returns**

A sampled secondary structure in dot-bracket notation

## 19.5 ViennaRNA/alifold.h File Reference

Functions for comparative structure prediction using RNA sequence alignments.

Include dependency graph for `alifold.h`:

**Functions**

- float `vrna_alifold` (const char \*\*sequences, char \*structure)  
*Compute Minimum Free Energy (MFE), and a corresponding consensus secondary structure for an RNA sequence alignment using a comparative method.*
- float `vrna_circalifold` (const char \*\*sequences, char \*structure)  
*Compute Minimum Free Energy (MFE), and a corresponding consensus secondary structure for a sequence alignment of circular RNAs using a comparative method.*
- float `vrna_pf_alifold` (const char \*\*sequences, char \*structure, `vrna_ep_t` \*\*pl)  
*Compute Partition function  $Q$  (and base pair probabilities) for an RNA sequence alignment using a comparative method.*
- float `vrna_pf_circalifold` (const char \*\*sequences, char \*structure, `vrna_ep_t` \*\*pl)  
*Compute Partition function  $Q$  (and base pair probabilities) for an alignment of circular RNA sequences using a comparative method.*
- float `alifold` (const char \*\*strings, char \*structure)  
*Compute MFE and according consensus structure of an alignment of sequences.*
- float `circalifold` (const char \*\*strings, char \*structure)

Compute MFE and according structure of an alignment of sequences assuming the sequences are circular instead of linear.

- void `free_alifold_arrays` (void)

Free the memory occupied by MFE alifold functions.

- float `energy_of_alistruct` (const char \*\*sequences, const char \*structure, int n\_seq, float \*energy)

Calculate the free energy of a consensus structure given a set of aligned sequences.

- float `alipf_fold_par` (const char \*\*sequences, char \*structure, `vrna_ep_t` \*\*pl, `vrna_exp_param_t` \*parameters, int calculate\_bppm, int is\_constrained, int is\_circular)
- float `alipf_fold` (const char \*\*sequences, char \*structure, `vrna_ep_t` \*\*pl)

The partition function version of `alifold()` works in analogy to `pf_fold()`. Pair probabilities and information about sequence covariations are returned via the 'pi' variable as a list of `vrna_pinfo_t` structs. The list is terminated by the first entry with `pi.i = 0`.

- float `alipf_circ_fold` (const char \*\*sequences, char \*structure, `vrna_ep_t` \*\*pl)
- `FLT_OR_DBL` \* `export_ali_bppm` (void)

Get a pointer to the base pair probability array.

- void `free_alipf_arrays` (void)

Free the memory occupied by folding matrices allocated by `alipf_fold`, `alipf_circ_fold`, etc.

- char \* `alipbacktrack` (double \*prob)

Sample a consensus secondary structure from the Boltzmann ensemble according its probability.

- int `get_alipf_arrays` (short \*\*\*S\_p, short \*\*\*S5\_p, short \*\*\*S3\_p, unsigned short \*\*\*a2s\_p, char \*\*\*Ss↔\_p, `FLT_OR_DBL` \*\*qb\_p, `FLT_OR_DBL` \*\*qm\_p, `FLT_OR_DBL` \*\*q1k\_p, `FLT_OR_DBL` \*\*qln\_p, short \*\*pscore)

Get pointers to (almost) all relevant arrays used in alifold's partition function computation.

- void `update_alifold_params` (void)

Update the energy parameters for alifold function.

## Variables

- double `cv_fact`

This variable controls the weight of the covariance term in the energy function of alignment folding algorithms.

- double `nc_fact`

This variable controls the magnitude of the penalty for non-compatible sequences in the covariance term of alignment folding algorithms.

### 19.14.1 Detailed Description

Functions and data structures for handling of secondary structure hard constraints.

### 19.14.2 Macro Definition Documentation

#### 19.14.2.1 VRNA\_CONSTRAINT\_NO\_HEADER

```
#define VRNA_CONSTRAINT_NO_HEADER 0
```

do not print the header information line

**Deprecated** This mode is not supported anymore!

### 19.14.2.2 VRNA\_CONSTRAINT\_DB\_ANG\_BRACK

```
#define VRNA_CONSTRAINT_DB_ANG_BRACK 524288U
```

angle brackets '<', '>' switch for structure constraint (paired downstream/upstream)

## 19.14.3 Enumeration Type Documentation

### 19.14.3.1 vrna\_hc\_type\_e

```
enum vrna_hc_type_e
```

The hard constraints type.

Global and local structure prediction methods use a slightly different way to handle hard constraints internally. This enum is used to distinguish both types.

Enumerator

VRNA_HC_DEFAULT	Default Hard Constraints.
VRNA_HC_WINDOW	Hard Constraints suitable for local structure prediction using window approach.  See also  <a href="#">vrna_mfe_window()</a> , <a href="#">vrna_mfe_window_zscore()</a> , <a href="#">pfl_fold()</a>

## 19.14.4 Function Documentation

### 19.14.4.1 vrna\_hc\_add\_data()

```
void vrna_hc_add_data (
    vrna_fold_compound_t * vc,
    void * data,
    vrna_callback_free_auxdata * f )
```

Add an auxiliary data structure for the generic hard constraints callback function.

See also

[vrna\\_hc\\_add\\_f\(\)](#)

## Parameters

<i>vc</i>	The fold compound the generic hard constraint function should be bound to
<i>data</i>	A pointer to the data structure that holds required data for function 'f'
<i>free_data</i>	A pointer to a function that free's the memory occupied by (Maybe NULL)

19.14.4.2 `print_tty_constraint()`

```
void print_tty_constraint (
    unsigned int option )
```

Print structure constraint characters to stdout. (constraint support is specified by option parameter)

**Deprecated** Use `vrna_message_constraints()` instead!

## Parameters

<i>option</i>	Option switch that tells which constraint help will be printed
---------------	--

19.14.4.3 `print_tty_constraint_full()`

```
void print_tty_constraint_full (
    void )
```

Print structure constraint characters to stdout (full constraint support)

**Deprecated** Use `vrna_message_constraint_options_all()` instead!

19.14.4.4 `constrain_ptypes()`

```
void constrain_ptypes (
    const char * constraint,
    unsigned int length,
    char * ptype,
    int * BP,
    int min_loop_size,
    unsigned int idx_type )
```

Insert constraining pair types according to constraint structure string.

**Deprecated** Do not use this function anymore! Structure constraints are now handled through `vrna_hc_t` and related functions.

## Parameters

<i>constraint</i>	The structure constraint string
<i>length</i>	The actual length of the sequence (constraint may be shorter)
<i>p<sub>type</sub></i>	A pointer to the basepair type array
<i>BP</i>	(not used anymore)
<i>min<sub>loop<sub>size</sub></sub></i>	The minimal loop size (usually <a href="#">TURN</a> )
<i>idx<sub>type</sub></i>	Define the access type for base pair type array (0 = indx, 1 = iindx)

### 19.16.1 Detailed Description

This module provides function to incorporate SHAPE reactivity data into the folding recursions by means of soft constraints.

### 19.16.2 Function Documentation

#### 19.16.2.1 vrna\_sc\_SHAPE\_parse\_method()

```
int vrna_sc_SHAPE_parse_method (
    const char * method_string,
    char * method,
    float * param_1,
    float * param_2 )
```

Parse a character string and extract the encoded SHAPE reactivity conversion method and possibly the parameters for conversion into pseudo free energies.

#### Parameters

<i>method_string</i>	The string that contains the encoded SHAPE reactivity conversion method
<i>method</i>	A pointer to the memory location where the method character will be stored
<i>param_1</i>	A pointer to the memory location where the first parameter of the corresponding method will be stored
<i>param_2</i>	A pointer to the memory location where the second parameter of the corresponding method will be stored

### Returns

### 19.34.1 Detailed Description

Here all all declarations of the global variables used throughout RNAlib.

### 19.34.2 Variable Documentation

#### 19.34.2.1 RibosumFile

```
char* RibosumFile
```

warning this variable will vanish in the future ribosums will be compiled in instead

### 19.34.2.2 james\_rule

```
int james_rule
```

interior loops of size 2 get energy 0.8Kcal and no mismatches, default 1

### 19.34.2.3 logML

```
int logML
```

use logarithmic multiloop energy function

### 19.34.2.4 cut\_point

```
int cut_point
```

Marks the position (starting from 1) of the first nucleotide of the second molecule within the concatenated sequence.

To evaluate the energy of a duplex structure (a structure formed by two strands), concatenate the two sequences and set it to the first base of the second strand in the concatenated sequence. The default value of -1 stands for single molecule folding. The cut\_point variable is also used by [vrna\\_file\\_PS\\_rnaplot\(\)](#) and [PS\\_dot\\_plot\(\)](#) to mark the chain break in postscript plots.

### 19.34.2.5 base\_pair

```
bondT* base_pair
```

Contains a list of base pairs after a call to [fold\(\)](#).

base\_pair[0].i contains the total number of pairs.

**Deprecated** Do not use this variable anymore!

### 19.34.2.6 pr

```
FLT_OR_DBL* pr
```

A pointer to the base pair probability matrix.

**Deprecated** Do not use this variable anymore!

### 19.34.2.7 iindx

```
int* iindx
```

index array to move through pr.

The probability for base i and j to form a pair is in pr[iindx[i]-j].

**Deprecated** Do not use this variable anymore!

### 19.41.1 Detailed Description

Energy evaluation for MFE and partition function calculations.

This file contains functions for the calculation of the free energy  $\Delta G$  of a hairpin- [ [E\\_Hairpin\(\)](#) ] or interior-loop [ [E\\_IntLoop\(\)](#) ].

The unit of the free energy returned is  $10^{-2} * \text{kcal/mol}$

In case of computing the partition function, this file also supplies functions which return the Boltzmann weights  $e^{-\Delta G/kT}$  for a hairpin- [ [exp\\_E\\_Hairpin\(\)](#) ] or interior-loop [ [exp\\_E\\_IntLoop\(\)](#) ].

## 19.52.1 Detailed Description

Partition function for two RNA sequences.

## 19.52.2 Function Documentation

### 19.52.2.1 co\_pf\_fold()

```
vrna_dimer_pf_t co_pf_fold (
    char * sequence,
    char * structure )
```

Calculate partition function and base pair probabilities.

This is the cofold partition function folding. The second molecule starts at the [cut\\_point](#) nucleotide.

#### Note

OpenMP: Since this function relies on the global parameters [do\\_backtrack](#), [dangles](#), [temperature](#) and [pf\\_scale](#) it is not threadsafe according to concurrent changes in these variables! Use [co\\_pf\\_fold\\_par\(\)](#) instead to circumvent this issue.

**Deprecated** {Use [vrna\\_pf\\_dimer\(\)](#) instead!}

#### Parameters

<i>sequence</i>	Concatenated RNA sequences
<i>structure</i>	Will hold the structure or constraints

#### Returns

[vrna\\_dimer\\_pf\\_t](#) structure containing a set of energies needed for concentration computations.

### 19.52.2.2 co\_pf\_fold\_par()

```
vrna_dimer_pf_t co_pf_fold_par (
    char * sequence,
    char * structure,
    vrna_exp_param_t * parameters,
    int calculate_bppm,
    int is_constrained )
```

Calculate partition function and base pair probabilities.

This is the cofold partition function folding. The second molecule starts at the [cut\\_point](#) nucleotide.

**Deprecated** Use [vrna\\_pf\\_dimer\(\)](#) instead!

See also

[get\\_boltzmann\\_factors\(\)](#), [co\\_pf\\_fold\(\)](#)

#### Parameters

<i>sequence</i>	Concatenated RNA sequences
<i>structure</i>	Pointer to the structure constraint
<i>parameters</i>	Data structure containing the precalculated Boltzmann factors
<i>calculate_bppm</i>	Switch to turn Base pair probability calculations on/off (0==off)
<i>is_constrained</i>	Switch to indicate that a structure constraint is passed via the structure argument (0==off)

#### Returns

`vrna_dimer_pf_t` structure containing a set of energies needed for concentration computations.

#### 19.52.2.3 `get_plist()`

```
vrna_ep_t* get_plist (
    vrna_ep_t * pl,
    int length,
    double cut_off )
```

DO NOT USE THIS FUNCTION ANYMORE

**Deprecated** { This function is deprecated and will be removed soon!} use [assign\\_plist\\_from\\_pr\(\)](#) instead!

#### 19.52.2.4 `compute_probabilities()`

```
void compute_probabilities (
    double FAB,
    double FEA,
    double FEB,
    vrna_ep_t * prAB,
    vrna_ep_t * prA,
    vrna_ep_t * prB,
    int Alength )
```

Compute Boltzmann probabilities of dimerization without homodimers.

Given the pair probabilities and free energies (in the null model) for a dimer AB and the two constituent monomers A and B, compute the conditional pair probabilities given that a dimer AB actually forms. Null model pair probabilities are given as a list as produced by [assign\\_plist\\_from\\_pr\(\)](#), the dimer probabilities 'prAB' are modified in place.

**Deprecated** { Use [vrna\\_pf\\_dimer\\_probs\(\)](#) instead!}

## Parameters

<i>FAB</i>	free energy of dimer AB
<i>FEA</i>	free energy of monomer A
<i>FEB</i>	free energy of monomer B
<i>prAB</i>	pair probabilities for dimer
<i>prA</i>	pair probabilities monomer
<i>prB</i>	pair probabilities monomer
<i>Alength</i>	Length of molecule A

19.52.2.5 `get_concentrations()`

```
vrna_dimer_conc_t* get_concentrations (
    double FEAB,
    double FEAA,
    double FEBB,
    double FEA,
    double FEB,
    double * startconc )
```

Given two start monomer concentrations a and b, compute the concentrations in thermodynamic equilibrium of all dimers and the monomers.

This function takes an array 'startconc' of input concentrations with alternating entries for the initial concentrations of molecules A and B (terminated by two zeroes), then computes the resulting equilibrium concentrations from the free energies for the dimers. Dimer free energies should be the dimer-only free energies, i.e. the FcAB entries from the `vrna_dimer_pf_t` struct.

**Deprecated** { Use `vrna_pf_dimer_concentrations()` instead! }

## Parameters

<i>FEAB</i>	Free energy of AB dimer (FcAB entry)
<i>FEAA</i>	Free energy of AA dimer (FcAB entry)
<i>FEBB</i>	Free energy of BB dimer (FcAB entry)
<i>FEA</i>	Free energy of monomer A
<i>FEB</i>	Free energy of monomer B
<i>startconc</i>	List of start concentrations [a0],[b0],[a1],[b1],...,[an],[bn],[0],[0]

## Returns

`vrna_dimer_conc_t` array containing the equilibrium energies and start concentrations

### 19.52.2.6 init\_co\_pf\_fold()

```
void init_co_pf_fold (
    int length )
```

DO NOT USE THIS FUNCTION ANYMORE

**Deprecated** { This function is deprecated and will be removed soon!}

### 19.52.2.7 export\_co\_bppm()

```
FLT_OR_DBL* export_co_bppm (
    void )
```

Get a pointer to the base pair probability array.

Accessing the base pair probabilities for a pair (i,j) is achieved by

```
FLT_OR_DBL *pr = export_bppm(); pr_ij = pr[iindx[i]-j];
```

**Deprecated** This function is deprecated and will be removed soon! The base pair probability array is available through the `vrna_fold_compound_t` data structure, and its associated `vrna_mx_pf_t` member.

See also

[vrna\\_idx\\_row\\_wise\(\)](#)

Returns

A pointer to the base pair probability array

### 19.52.2.8 free\_co\_pf\_arrays()

```
void free_co_pf_arrays (
    void )
```

Free the memory occupied by [co\\_pf\\_fold\(\)](#)

**Deprecated** This function will be removed for the new API soon! See [vrna\\_pf\\_dimer\(\)](#), [vrna\\_fold\\_compound\(\)](#), and [vrna\\_fold\\_compound\\_free\(\)](#) for an alternative

### 19.52.2.9 update\_co\_pf\_params()

```
void update_co_pf_params (
    int length )
```

Recalculate energy parameters.

This function recalculates all energy parameters given the current model settings.

**Deprecated** Use [vrna\\_exp\\_params\\_subst\(\)](#) instead!

## Parameters

<i>length</i>	Length of the current RNA sequence
---------------	------------------------------------

## 19.52.2.10 update\_co\_pf\_params\_par()

```
void update_co_pf_params_par (
    int length,
    vrna_exp_param_t * parameters )
```

Recalculate energy parameters.

This function recalculates all energy parameters given the current model settings. It's second argument can either be NULL or a data structure containing the precomputed Boltzmann factors. In the first scenario, the necessary data structure will be created automatically according to the current global model settings, i.e. this mode might not be threadsafe. However, if the provided data structure is not NULL, threadsafety for the model parameters [dangles](#), [pf\\_scale](#) and [temperature](#) is regained, since their values are taken from this data structure during subsequent calculations.

**Deprecated** Use [vrna\\_exp\\_params\\_subst\(\)](#) instead!

## Parameters

<i>length</i>	Length of the current RNA sequence
<i>parameters</i>	data structure containing the precomputed Boltzmann factors

### 19.57.1 Detailed Description

Various functions for plotting RNA secondary structures.

### 19.57.2 Function Documentation

#### 19.57.2.1 PS\_rna\_plot\_snoop\_a()

```
int PS_rna_plot_snoop_a (
    const char * string,
    const char * structure,
    const char * ssfile,
    int * relative_access,
    const char * seqs[] )
```

plotting\_utils

### 19.57.2.2 `vrna_file_PS_rnaplot()`

```
int vrna_file_PS_rnaplot (
    const char * seq,
    const char * structure,
    const char * file,
    vrna_md_t * md_p )
```

Produce a secondary structure graph in PostScript and write it to 'filename'.

Note that this function has changed from previous versions and now expects the structure to be plotted in dot-bracket notation as an argument. It does not make use of the global `base_pair` array anymore.

#### Parameters

<i>seq</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>file</i>	The filename of the postscript output
<i>md_p</i>	Model parameters used to generate a commandline option string in the output (Maybe NULL)

#### Returns

1 on success, 0 otherwise

### 19.57.2.3 `vrna_file_PS_rnaplot_a()`

```
int vrna_file_PS_rnaplot_a (
    const char * seq,
    const char * structure,
    const char * file,
    const char * pre,
    const char * post,
    vrna_md_t * md_p )
```

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.

Same as `vrna_file_PS_rnaplot()` but adds extra PostScript macros for various annotations (see generated PS code). The 'pre' and 'post' variables contain PostScript code that is verbatim copied in the resulting PS file just before and after the structure plot. If both arguments ('pre' and 'post') are NULL, no additional macros will be printed into the PostScript.

#### Parameters

<i>seq</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>file</i>	The filename of the postscript output
<i>pre</i>	PostScript code to appear before the secondary structure plot
<i>post</i>	PostScript code to appear after the secondary structure plot
<i>md_p</i>	Model parameters used to generate a commandline option string in the output (Maybe NULL)

**Returns**

1 on success, 0 otherwise

**19.57.2.4 gmlRNA()**

```
int gmlRNA (
    char * string,
    char * structure,
    char * ssfile,
    char option )
```

Produce a secondary structure graph in Graph Meta Language (gml) and write it to a file.

If 'option' is an uppercase letter the RNA sequence is used to label nodes, if 'option' equals 'X' or 'x' the resulting file will coordinates for an initial layout of the graph.

**Parameters**

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the gml output
<i>option</i>	The option flag

**Returns**

1 on success, 0 otherwise

**19.57.2.5 ssv\_rna\_plot()**

```
int ssv_rna_plot (
    char * string,
    char * structure,
    char * ssfile )
```

Produce a secondary structure graph in SStructView format.

Write coord file for SStructView

**Parameters**

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the ssv output

**Returns**

1 on success, 0 otherwise

**19.57.2.6 svg\_rna\_plot()**

```
int svg_rna_plot (
    char * string,
    char * structure,
    char * ssfile )
```

Produce a secondary structure plot in SVG format and write it to a file.

**Parameters**

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the svg output

**Returns**

1 on success, 0 otherwise

**19.57.2.7 xrna\_plot()**

```
int xrna_plot (
    char * string,
    char * structure,
    char * ssfile )
```

Produce a secondary structure plot for further editing in XRNA.

**Parameters**

<i>string</i>	The RNA sequence
<i>structure</i>	The secondary structure in dot-bracket notation
<i>ssfile</i>	The filename of the xrna output

**Returns**

1 on success, 0 otherwise

### 19.57.2.8 PS\_rna\_plot()

```
int PS_rna_plot (
    char * string,
    char * structure,
    char * file )
```

Produce a secondary structure graph in PostScript and write it to 'filename'.

**Deprecated** Use [vrna\\_file\\_PS\\_rnaplot\(\)](#) instead!

### 19.57.2.9 PS\_rna\_plot\_a()

```
int PS_rna_plot_a (
    char * string,
    char * structure,
    char * file,
    char * pre,
    char * post )
```

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename'.

**Deprecated** Use [vrna\\_file\\_PS\\_rnaplot\\_a\(\)](#) instead!

### 19.57.2.10 PS\_rna\_plot\_a\_gquad()

```
int PS_rna_plot_a_gquad (
    char * string,
    char * structure,
    char * ssfile,
    char * pre,
    char * post )
```

Produce a secondary structure graph in PostScript including additional annotation macros and write it to 'filename' (detect and draw g-quadruplexes)

**Deprecated** Use [vrna\\_file\\_PS\\_rnaplot\\_a\(\)](#) instead!

## 19.59 ViennaRNA/profiledist.h File Reference

Include dependency graph for profiledist.h:

## Functions

- float [profile\\_edit\\_distance](#) (const float \*T1, const float \*T2)  
*Align the 2 probability profiles T1, T2*
- float \* [Make\\_bp\\_profile\\_bppm](#) (FLT\_OR\_DBL \*bppm, int length)  
*condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.*

*print string representation of probability profile*
- void [free\\_profile](#) (float \*T)  
*free space allocated in Make\_bp\_profile*
- float \* [Make\\_bp\\_profile](#) (int length)

### 19.59.1 Function Documentation

#### 19.59.1.1 [profile\\_edit\\_distance\(\)](#)

```
float profile_edit_distance (
    const float * T1,
    const float * T2 )
```

Align the 2 probability profiles T1, T2

.

This is like a Needleman-Wunsch alignment, we should really use affine gap-costs ala Gotoh

### 19.59.1.2 Make\_bp\_profile\_bppm()

```
float* Make_bp_profile_bppm (
    FLT_OR_DBL * bppm,
    int length )
```

condense pair probability matrix into a vector containing probabilities for unpaired, upstream paired and downstream paired.

This resulting probability profile is used as input for `profile_edit_distance`

**Parameters**

<i>bppm</i>	A pointer to the base pair probability matrix
<i>length</i>	The length of the sequence

**Returns**

The bp profile

**19.59.1.3 free\_profile()**

```
void free_profile (
    float * T )
```

free space allocated in Make\_bp\_profile

Backward compatibility only. You can just use plain free()

**19.59.1.4 Make\_bp\_profile()**

```
float* Make_bp_profile (
    int length )
```

**Note**

This function is NOT threadsafe

**See also**

[Make\\_bp\\_profile\\_bppm\(\)](#)

**Deprecated** This function is deprecated and will be removed soon! See [Make\\_bp\\_profile\\_bppm\(\)](#) for a replacement

*Produce a postscript dot-plot from two pair lists.*
- int [PS\\_dot\\_plot](#) (char \*string, char \*file)  
*Produce postscript dot-plot.*

### 19.60.1 Detailed Description

Various functions for plotting RNA secondary structures, dot-plots and other visualizations.

## 19.61 ViennaRNA/read\_epars.h File Reference

Read and write energy parameter files.

## Functions

- const char \* [last\\_parameter\\_file](#) (void)  
*Get the file name of the parameter file that was most recently loaded.*
- void [read\\_parameter\\_file](#) (const char fname[ ])  
*Read energy parameters from a file.*
- void [write\\_parameter\\_file](#) (const char fname[ ])  
*Write energy parameters to a file.*

### 19.61.1 Detailed Description

Read and write energy parameter files.

## 19.62 ViennaRNA/ribo.h File Reference

Parse RiboSum Scoring Matrices for Covariance Scoring of Alignments.

This graph shows which files directly or indirectly include this file:

## Functions

- float \*\* [get\\_ribosum](#) (const char \*\*Alseq, int n\_seq, int length)  
*Retrieve a RiboSum Scoring Matrix for a given Alignment.*
- float \*\* [readribosum](#) (char \*name)

### 19.62.1 Detailed Description

Parse RiboSum Scoring Matrices for Covariance Scoring of Alignments.

## 19.63 ViennaRNA/RNAstruct.h File Reference

Parsing and Coarse Graining of Structures.

### Functions

- char \* [b2HIT](#) (const char \*structure)  
*Converts the full structure from bracket notation to the HIT notation including root.*
- char \* [b2C](#) (const char \*structure)  
*Converts the full structure from bracket notation to the a coarse grained notation using the 'H' 'B' 'I' 'M' and 'R' identifiers.*
- char \* [b2Shapiro](#) (const char \*structure)  
*Converts the full structure from bracket notation to the weighted coarse grained notation using the 'H' 'B' 'I' 'M' 'S' 'E' and 'R' identifiers.*
- char \* [add\\_root](#) (const char \*structure)  
*Adds a root to an un-rooted tree in any except bracket notation.*
- char \* [expand\\_Shapiro](#) (const char \*coarse)  
*Inserts missing 'S' identifiers in unweighted coarse grained structures as obtained from [b2C\(\)](#).*
- char \* [expand\\_Full](#) (const char \*structure)  
*Convert the full structure from bracket notation to the expanded notation including root.*
- char \* [unexpand\\_Full](#) (const char \*ffull)  
*Restores the bracket notation from an expanded full or HIT tree, that is any tree using only identifiers 'U' 'P' and 'R'.*
- char \* [unweight](#) (const char \*wcoarse)  
*Strip weights from any weighted tree.*
- void [unexpand\\_aligned\\_F](#) (char \*align[2])  
*Converts two aligned structures in expanded notation.*
- void [parse\\_structure](#) (const char \*structure)  
*Collects a statistic of structure elements of the full structure in bracket notation.*

### Variables

- int [loop\\_size](#) [STRUC]  
*contains a list of all loop sizes. `loop_size[0]` contains the number of external bases.*
- int [helix\\_size](#) [STRUC]  
*contains a list of all stack sizes.*
- int [loop\\_degree](#) [STRUC]  
*contains the corresponding list of loop degrees.*
- int [loops](#)  
*contains the number of loops ( and therefore of stacks ).*
- int [unpaired](#)  
*contains the number of unpaired bases.*
- int [pairs](#)  
*contains the number of base pairs in the last parsed structure.*

### 19.63.1 Detailed Description

Parsing and Coarse Graining of Structures.

Example:

```
* .((..((...))..((..))). is the bracket or full tree

### 19.64.1 Detailed Description

General utility- and helper-functions for RNA sequence and structure strings used throughout the ViennaRNA Package.

### 19.64.2 Function Documentation

### 19.64.2.1 str\_uppercase()

```
void str_uppercase (
    char * sequence )
```

Convert an input sequence to uppercase.

**Deprecated** Use [vrna\\_seq\\_toupper\(\)](#) instead!

### 19.64.2.2 str\_DNA2RNA()

```
void str_DNA2RNA (
    char * sequence )
```

Convert a DNA input sequence to RNA alphabet.

**Deprecated** Use [vrna\\_seq\\_toRNA\(\)](#) instead!

### 19.64.2.3 random\_string()

```
char* random_string (
    int l,
    const char symbols[] )
```

Create a random string using characters from a specified symbol set.

**Deprecated** Use [vrna\\_random\\_string\(\)](#) instead!

### 19.64.2.4 hamming()

```
int hamming (
    const char * s1,
    const char * s2 )
```

Calculate hamming distance between two sequences.

**Deprecated** Use [vrna\\_hamming\\_distance\(\)](#) instead!

### 19.64.2.5 hamming\_bound()

```
int hamming_bound (
    const char * s1,
    const char * s2,
    int n )
```

Calculate hamming distance between two sequences up to a specified length.

**Deprecated** Use [vrna\\_hamming\\_distance\\_bound\(\)](#) instead!

Convert a structure into a format suitable for [string\\_edit\\_distance\(\)](#).

#### Parameters

<a href="#">string</a>	
------------------------	--

Returns

### 19.65.2.2 string\_edit\_distance()

```
float string_edit_distance (
    swString * T1,
    swString * T2 )
```

Calculate the string edit distance of T1 and T2.

Parameters

<i>T1</i>	
<i>T2</i>	

Returns

### 19.72.1 Detailed Description

General utility- and helper-functions used throughout the *ViennaRNA Package*.

### 19.72.2 Function Documentation

#### 19.72.2.1 `get_line()`

```
char* get_line (
    FILE * fp )
```

Read a line of arbitrary length from a stream.

Returns a pointer to the resulting string. The necessary memory is allocated and should be released using `free()` when the string is no longer needed.

**Deprecated** Use `vrna_read_line()` as a substitute!

### Parameters

<i>fp</i>	A file pointer to the stream where the function should read from
-----------	--

### Returns

A pointer to the resulting string

#### 19.72.2.2 `print_tty_input_seq()`

```
void print_tty_input_seq (
    void )
```

Print a line to *stdout* that asks for an input sequence.

There will also be a ruler (scale line) printed that helps orientation of the sequence positions

**Deprecated** Use `vrna_message_input_seq_simple()` instead!

#### 19.72.2.3 `print_tty_input_seq_str()`

```
void print_tty_input_seq_str (
    const char * s )
```

Print a line with a user defined string and a ruler to stdout.

(usually this is used to ask for user input) There will also be a ruler (scale line) printed that helps orientation of the sequence positions

**Deprecated** Use `vrna_message_input_seq()` instead!

#### 19.72.2.4 `warn_user()`

```
void warn_user (
    const char message[ ] )
```

Print a warning message.

Print a warning message to *stderr*

**Deprecated** Use `vrna_message_warning()` instead!

#### 19.72.2.5 nrerror()

```
void nrerror (
    const char message[] )
```

Die with an error message.

**Deprecated** Use [vrna\\_message\\_error\(\)](#) instead!

#### 19.72.2.6 space()

```
void* space (
    unsigned size )
```

Allocate space safely.

**Deprecated** Use [vrna\\_alloc\(\)](#) instead!

#### 19.72.2.7 xrealloc()

```
void* xrealloc (
    void * p,
    unsigned size )
```

Reallocate space safely.

**Deprecated** Use [vrna\\_realloc\(\)](#) instead!

#### 19.72.2.8 init\_rand()

```
void init_rand (
    void )
```

Make random number seeds.

**Deprecated** Use [vrna\\_init\\_rand\(\)](#) instead!

### 19.72.2.9 urn()

```
double urn (
    void )
```

get a random number from [0..1]

**Deprecated** Use `vrna_urn()` instead!

### 19.72.2.10 int\_urn()

```
int int_urn (
    int from,
    int to )
```

Generates a pseudo random integer in a specified range.

**Deprecated** Use `vrna_int_urn()` instead!

### 19.72.2.11 filecopy()

```
void filecopy (
    FILE * from,
    FILE * to )
```

Inefficient `cp`

**Deprecated** Use `vrna_file_copy()` instead!

### 19.72.2.12 time\_stamp()

```
char* time_stamp (
    void )
```

Get a timestamp.

**Deprecated** Use `vrna_time_stamp()` instead!

- `#define VRNA_PATH_RANDOM 256`  
*Option flag to request a random walk path.*
- `#define VRNA_PATH_NO_TRANSITION_OUTPUT 512`  
*Option flag to omit returning the transition path.*
- `#define VRNA_PATH_DEFAULT (VRNA_PATH_STEEPEST_DESCENT | VRNA_MOVESET_DEFAULT)`  
*Option flag to request defaults (steepest descent / default move set)*

### Functions

- `vrna_move_t * vrna_path (vrna_fold_compound_t *vc, short *pt, unsigned int steps, unsigned int options)`  
*Compute a path, store the final structure, and return a list of transition moves from the start to the final structure.*
- `vrna_move_t * vrna_path_gradient (vrna_fold_compound_t *vc, short *pt, unsigned int options)`  
*Compute a steepest descent / gradient path, store the final structure, and return a list of transition moves from the start to the final structure.*
- `vrna_move_t * vrna_path_random (vrna_fold_compound_t *vc, short *pt, unsigned int steps, unsigned int options)`  
*Generate a random walk / path of a given length, store the final structure, and return a list of transition moves from the start to the final structure.*

### 19.73.1 Detailed Description

Methods to generate particular paths such as gradient or random walks through the energy landscape of an RNA sequence.
